OCTOBER 2020

## Vision

To be the foremost Institute for agricultural extension research and capacity development for effective service delivery, increased agricultural productivity, sustainable agricultural growth and wealth creation.

## **Mission Statement**

To develop, collate, evaluate and disseminate proven and relevant agricultural innovations; research on extension methodologies; and provide leadership in capacity building of stakeholders to meet the present and future agricultural development of the country.

## **Mandate**

- Advance the frontiers of agricultural extension research and services
- Conduct agricultural performance assessment and provide feedbacks
- Build the capacity and skill of key actors in agricultural extension services
- Plan, coordinate, monitor and evaluate REFILS activities nationwide
- Package and disseminate improved agricultural innovations to target users in Nigeria
- Review and support the extension activities of agricultural research institutes

#### **PREFACE**

One of the core mandates of NAERLS is the annual assessment of agricultural performance. Despite the COVID-19 Pandemic, the 2020 Wet Season Agricultural Performance Survey was conducted from 23<sup>rd</sup> to 30<sup>th</sup> August, after the lockdown was relaxed. In conducting the Survey, NAERLS collaborated with the following Agencies and Organisations: Federal Department of Agriculture (FDA), Federal Department of Agricultural Extension (FDAE), Planning and Policy Coordination Department (P&PCD), Federal Department of Fisheries and Aquaculture (FDF&A), Federal Department of Animal Production and Husbandry Services (FDAP&HS); Federal Department of Veterinary and Pest Control Services (FDV&PCS), National Agricultural Seeds Council (NASC); National Bureau of Statistics (NBS); Nigerian Meteorological Agency (NIMET); The Nigeria Incentive-Based Risk Sharing System for Agricultural Lending (NIRSAL), Institute for Agricultural Research (IAR); Institute of Agricultural Research and Training (IAR&T); Lake Chad Research Institute (LCRI); National Roots Crops Research Institute (NRCRI), National Cereals Research Institute (NCRI); Nigerian Institute for Oil Palm Research (NIFOR); National Animal Production Research Institute (NAPRI); Sokoto Rima River Basin Development Authority (SRRBDA), Sasakawa Global 2000 (SG2000), 36 States and FCT Agricultural Development Programmes (ADPs), 36 State Ministries of Agriculture and FCT Department of Agriculture.

Nineteen (19) teams consisting of 56 scientists covered the 36 States and the Federal Capital Territory (FCT). A monitoring team of six scientists, one per geo-political zone, participated in the survey. Agricultural production situation was assessed as well as impact of floods on food production due to widespread incidence of flood in the country. The impact of COVID-19 on agricultural production was also part of the survey. The report provides an insight into annual cropping season with emphasis on food production, crop pests and disease situation, market situation, commodity prices, agro-meteorological conditions, and agro-pastoral situation across the country. The survey also provides insight on performance of policy thrust as well as progress made on special interventions and programmes on agriculture by the Federal and States Governments. The outputs of the evaluation exercise are put together into an executive summary and national report, which are usually circulated to all States, relevant agencies and other stakeholders. The report provides findings and data that can guide policy formulation and focused research in agriculture. Floods are becoming increasingly a common and recurring disaster annually in the country; therefore, reports of floods were documented nation-wide. The frequency, severity, and spread of these floods increased significantly and were monitored up to September 2020. In an effort to improve the quality and reliability of the data generation, NAERLS continually explores best options in strengthening the capacity of key partners in data collection and management.

NAERLS sincerely appreciates farmers and farmers' groups, officials of Ministries, Departments and Agencies (MDAs) at Federal and State levels for contributing substantially to the success of the field work. We are highly indebted to the Honourable Minister of Agriculture and Rural Development, Alhaji Muhammad Sabo Nanono and the Honourable Minister of State, Alhaji Mustapha Baba Shehuri for their untiring support. We greatly appreciate the support of the Board Chairman of NAERLS and Vice-Chancellor of Ahmadu Bello University, Zaria, Prof. Kabiru Bala. As stakeholders browse this report, suggestions and comments are welcome for improvement.

Prof. M. K. Othman

Executive Director, NAERLS

#### **EXECUTIVE SUMMARY**

The 2020 Wet Season Agricultural Performance Survey was conducted between 23rd and 30th August. The survey was carried out by NAERLS in collaboration with the Agricultural Development Programmes (ADPs) and Ministries of Agriculture (MoAs) of the 36 States, Departments of the Federal Ministry of Agriculture and Rural Development, Research Institutes, other Federal Agencies and NGOs. The survey results and findings are summarized below.

#### **Weather Situation**

Generally, there was less rainfall in 2020 than 2019. There was late onset of rains across the zones and the distribution pattern changed. The southwest and most of the north central zone like Kwara, Kogi, Niger, Benue, Plateau and Nasarawa States experienced cessation of rainfall for between 5 - 6 weeks between July and August. There was also cessation of rain of between 2 and 4 weeks in the southeast zone as well as Edo state. The data also showed widescale occurrences of flood in many parts of the country.

#### **Farm Inputs Procurement and Distribution**

About 27 States reported procuring and distributing seeds and seedlings, agrochemicals, fertilizers and farm equipment to farmers. However, the inputs were found to be inadequate and largely unaffordable to farmers. The major seeds and seedlings procured and distributed were maize, rice, sorghum, soybean, millet, sesame, cowpea, cassava cuttings, pepper, oil palm, plantain and banana. The sources of the seeds and seedlings procured were private seed companies, State governments and special projects. Moreover, farmers were able to access limited fertilizers (NPK, Urea, SSP and liquid fertilizers) for their fields through the following sources: governments (of 24 States providing subsidy), Rice Farmers Association of Nigeria (RIFAN) and the open markets. Also, State governments procured and distributed tractors, draught implements, agro-processing equipment, power tillers, reapers, and bulls to farmers in 25 States.

#### **Pests and Diseases Incidence**

Incidences of pests and diseases on crops were reported in more than 30 States. The prominent pests and diseases of tuber crops were mosaic, leaf wilts, bacterial blights, rodents and birds with an estimated yield loss of 30%. Cereals and legumes were generally infested with army worm, stem borers, pod borers, and birds. Fall army worm was reported in all the States, with an average yield loss of 45%. Control measures taken included the use of chemicals, application of good agricultural practices (GAP), practice of integrated farming, destruction of disease nests and some cultural control methods.

#### **Agricultural Mechanization and Animal Traction**

The total number of functional government tractors reported for 2020 in Nigeria was 642, which was a 58.39% decrease from the 1,534 tractors reported in 2019. In the private sector, the available functional tractors were 2,205, an increase of 7.40% over the 2,053 reported in 2019. With regard to animal traction, Adamawa had the highest number of bulls (200,000), while Gombe had the least number of 6,150 among the 12 states that reported animal traction activities.

#### **Cost of Tillage Operation**

There were increases in the costs of tillage operations, as well as for land clearing in the northeast and northwest zones. There was, however, some reduction in these costs in some States of the north-central (Kwara, Benue, Kogi and Plateau) and in the southwest.

#### **Grain Reserves**

There were silo complexes owned and operated by the Food and Strategic Reserves Department of the Federal Government and some State governments. Four States in the northeast and six States in the north-central zones have functional strategic grain reserves of storage capacities ranging from 4,000MT to 25,000MT for maize, sorghum, millet, and gari. Three States each in the southeast and south-south have functional grain reserves with capacities between 25,000 and 100,000MT.

#### **Cost of Production of Major Crops**

The costs of producing major crops generally increased across the country, sometimes by as much as 167% (as recorded in Imo State for rice production). There were also instances of cost reductions-for example, the costs for cowpea and millet reduced by 52.7% and 52.0% respectively in Borno State. The increases were especially alluded to the high costs of inputs occasioned by the economic restrictions imposed globally as a result of Covid-19.

#### **Food Commodity Prices**

The survey results also showed that market prices of foods experienced significant increases, ranging from 11% for groundnut in Adamawa, through 35% for paddy rice in Bauchi and 50% each for beef in Kwara and goat meat in Sokoto, to 83% for rice in the southeastern States.

#### **Production Estimates of Major Crops**

#### Rice

The estimated cropped area for rice in 2020 was 4,195,070Ha, which represented an increase of about 1.66% over the 4,126,670Ha cultivated in 2019. Owing to the flood that affected some States, the national rice output is estimated to decrease by 3%, that is, from 8,435,610 tons in 2019 to about 8,171,750 tons in 2020. About 76% of the States recorded decrease in the output of rice.

#### Maize

The total estimated land area cultivated for maize in 2020 is about 6,048,610Ha, indicating a 0.25% increase over the 6,033,410Ha cultivated in 2019. Similarly, maize production declined from 12.6 million tons in 2019 to 12.4 million tons in 2020 representing a 1.55% reduction arising from rainfall deficit (prolonged dry-spell) in the South West, North-Central and some parts of the South East Zones, flooding in some parts of the North East and North West Zones and inadequate fertilizer application on maize farms.

#### Sorghum

Sorghum is mostly grown in the Northern States of Nigeria with total estimated planted land area of 5,799,590Ha in 2020, indicating a decline in cultivated land area of 0.37% relative to 5,821,240Ha recorded in 2019. The production of sorghum in 2020 recorded a drop in the North East and North West zones, when compared to what was obtained in 2019. Some States in the North Central Zone

also recorded a decrease in production when compared to 2019. The output of sorghum of 6,590,400 tons represented a decrease of about 1.17% compared to 2019 production figure of 6,668,240 tons.

#### Cowpea

The total land area put to production of cowpea in 2020 was 4,973,520Ha which is an increase of 0.86% over 4,931,320Ha cultivated in 2019. The North Central Zone is the highest producer of cowpea, contributing over 29% of cowpea production in the country. The zone is closely followed by the North East, which contributed 25% of the total output. National output figure for cowpea in 2020 (4,132,830 tons) showed an increase of 1.68% when compared to that of 2019.

#### Groundnut

Groundnut is produced mainly in the Northern States but some few southern States also produce some amounts. The estimated land area put to production of groundnut in 2020 was 3,596,420Ha, a slight increase of 0.5% over 3,578,670Ha cultivated in 2019. Although some of these States recorded marginal increase in the production of groundnut, the North Central Zone recorded a decline in production. The percentage increase on a national scale was 0.52%, that is, from 4,441,010 tons in 2019 to 4,464,020 tons in 2020

#### Soybean

The estimated land area put to production of soybean in 2020 was 1,207,740Ha, representing an increase 5.2% over the 2019 figure of 1,148,050Ha. The North Central and North West zones are the major soybean producing areas, accounting for 82% of national production. The major producing States are Benue, Kaduna, Taraba and Niger. Nationally, the crop recorded an increase of 5.48% over the figure of 2019, that is from 1,048,510 tons in 2019 to 1,105,950 tons in 2020. Increase in the production of soybean occurred largely because farmers of cereals such as maize and sorghum shifted to legumes that require less fertilizer application.

#### Cassava

Cassava is cultivated in all agro-ecological zones of Nigeria. Estimated cassava area in 2020 was 9,609,080Ha reflecting a 1.71% decrease from 9,776,650Ha of 2019. The major producers of cassava are States in the North Central, the South-South, South-East and South West zones. Cassava is one of the major root crops in the country but it did not record a significant change in output in 2020. A decrease of about 2.47% in output is expected for cassava in 2020, from the 2019 output of 5,696,160 tons.

#### **Livestock Production**

With regards to livestock, there was a total of 20,585,000 heads of cattle in 2020, an increase of 0.2% over the 2019 data of 20,407,000; and 223,704,000 chicken, about 0.1% increase over 208,096,000 in 2019. Sheep population was 47,926,000 (0.3% more than 46,757,000 for 2019) and goats, 84,039,000, an increase of 0.2% over the estimated population of 82,714,000 in 2019. These marginal increases were recorded despite widespread livestock pests and diseases recorded, which included: Bovine Pleuroneumonia (CBPP), helminthiasis, *peste des petits ruminants* (PPR), *fasciola*, Mange and foot rot. About 8 States and the FCT distributed animal feed, supplements, disinfectants and insecticide, as well as vaccines for CBPP and PPR, day-old-chicks and turkey poults, and weaner goats.

#### **Fisheries Production**

There was generally paucity of data for artisanal fisheries production in all the agro-ecologies. However, available data showed decreases in production, compared to 2019. A few States and the FCT procured and distributed fisheries inputs to farmers, such as fingerlings, feeds, nets, outboard engines, collapsible tarpaulin ponds, cold store and smoking kilns.

#### **Flood Damage Assessment**

Flooding occurs in Nigeria annually with devastating impacts on the poor and vulnerable populations who live along the river banks and other flood prone areas. As at September 2020, 24 States and the FCT were affected with different severity of damages to crops, livestock, cultured fish, social and farm infrastructures and human lives. Flood situations were reported in almost all the States in Northern Nigeria with the exception of Benue State. However, flooding was reported in six States in the Southern part of the country. Major crops affected were rice, maize, sorghum and cassava with different severity of damages. Suggested strategies that can be used in assisting the distribution of relief materials and farm inputs to the affected farmers includes direct assistance through cash transfer using the farmers' BVN and reaching farmers through their cooperatives, registered groups or associations.

#### **Impact of Coronavirus Pandemic on Agricultural Production**

The Agricultural Performance Survey 2020 revealed that 99.7% of the farmers were aware of the COVID 19 pandemic and 76% of the farmers received such knowledge from community health workers as well as the broadcast media (TV and Radio) through the National Centre for Disease Control (NCDC). The pandemic disrupted food production systems, posing a great threat to farmers' livelihoods as well as national food and nutritional security. The pandemic adversely affected livestock and fisheries production. In many places, loss of demand and difficulties in reaching consumers has led to volatile prices. In addition, the health and safety measures implemented reduced labour mobility all along the supply chain.

#### **Constraints to Agricultural Production**

With regards to the general constraints to agricultural productivity in 2020, the study showed that the global Covid-19 pandemic caused a rise in the prices of inputs averagely by over 90% and shortage of farm labour by 67%, among others. Moreover, flooding and draught/ prolonged dry spells destroyed thousands of hectares of rice, maize and sorghum fields across the nation. The results also show that government inputs were largely inadequate and unavailable/ inaccessible. The data also indicated that extension activities have continued to decline, a worrisome trend since 2009. One state ADP was even scrapped entirely and the staff posted to different Ministries in the state. The ADPs were highly under-staffed and underfunded. The poor funding situation implied that farmers were left without quality information for agricultural decisions. Finally, the survey showed that there has been a drastic increase in insecurity matters across the nation, from cattle rustling, to kidnapping, militancy and banditry.

#### 1.0. INTRODUCTION

The Agricultural Performance Survey (APS) is one of the key mandates of the National Agricultural Extension and Research Liaison Services (NAERLS), Ahmadu Bello University, Zaria. Tools for the survey are reviewed each year for improvement in the data collection and outputs. Stakeholders on agricultural data generation and dissemination consisting of Federal, States, National and International Governmental and non-Governmental Organizations validate the survey tools for inclusiveness of issues in agricultural development across the sector and related sectors. ADP and Ministry of Agriculture staff across the country were trained virtually on the use of ODK to capture data and on correct filling of the study tools which were dispatched ahead of the field exercise to relevant Departments in the Federal and State Ministries of Agriculture, the State Agricultural Development Projects and other agencies. The essence of this is to enable these agencies collate and certify the available data prior to the commencement of the survey.

The survey has four strategic objectives;

- Assess the performance of the agricultural sector during the wet season and forecast the likely production outputs for the year;
- Identify constraints to increased agricultural productivity;
- Identify conditions affecting effective technology transfer and advisory services within the season; and
- Provide feedback on field situation and farmers' problems for improved research and policy action.

The 2020 APS field work was conducted between 23<sup>rd</sup> and 30<sup>th</sup> August by the Institute in collaboration with the following agencies and organisations: Federal Department of Agriculture (FDA), Federal Department of Agricultural Extension (FDAE), Planning and Policy Coordination Department (P&PCD), Federal Department of Fisheries and Aquaculture (FDF&A), Federal Department of Animal Production and Husbandry Services (FDAP&HS); Federal Department of Veterinary and Pest Control Services (FDV&PCS), National Agricultural Seeds Council (NASC); National Bureau of Statistics (NBS); Nigerian Meteorological Agency (NIMET); The Nigeria Incentive-Based Risk Sharing System for Agricultural Lending (NIRSAL), Institute for Agricultural Research (IAR); Institute of Agricultural Research and Training (IAR&T); Lake Chad Research Institute (LCRI); National Animal Production Research Institute (NAPRI); National Roots Crops Research Institute (NRCRI), National Cereals Research Institute (NCRI), Sokoto Rima River Basin Development Authority (SRRBDA), Sasakawa Global 2000 (SG2000), 36 States and FCT Agricultural Development Programmes (ADPs), 36 State Ministries of Agriculture and FCT Department of Agriculture.

The APS Report is usually presented publicly during the World Food Day celebration by the Honourable Minister of Agriculture and Rural Development. Findings in the report assist the Government in assessing the agricultural sector performance as well as providing policy direction in achieving the desired food security drive of the country.

#### 2.0. METHODOLOGY

Nineteen (19) multi-disciplinary teams of three scientists each conducted the survey across the 36 States of the Federation and FCT using Participatory Rural Appraisal (PRA) techniques. Structured questionnaire, checklists, field visits, focus group discussions, key-informant interviews and review of official documents were used in data collection.

Due to the challenges of COVID-19, an innovative on-line training was adopted to build the capacity of staff of ADPs and State Ministries of Agriculture across the country on the filling of the survey tools and on the use of ODK to capture data for the exercise.

The primary data collection instrument used was the questionnaire served to the ADPs, Ministries and other Parastatals. Sampling involved selection of two ADP zones per State, two LGAs per zone, one community per LGA and five respondents per community, giving a total of 725 respondents nation-wide. The farmers' interview covered agricultural value chain activities. In furtherance of the effort to add value to the exercise in terms of quality, utility and depth of data generated, data from farmers were captured electronically using tablets. Wrap-up sessions to validate data generated were held with officials of the State ADPs and Ministries of Agriculture and in few cases, farmer's organizations. Data collected were analyzed and results presented in tables, figures, charts and plates. The findings are presented as follows:

#### 3.0. WEATHER SITUATION

#### 3.1. Rainfall

Generally, lesser amount of rainfall was experienced in all the zones in 2020 compared with 2019 except North West that reported higher amount of rainfall as indicated in Tables 3.1 to Table 3.6. and Fig 3.1 to Fig 3.6. All the zones reported less rainy days in 2020 when compared with 2019 as revealed by the data in Tables 3.7 to Table 3.12 and Fig 3.7 to Fig 3.12.

There was a little delay in the commencement of rainfall across the zones in 2020 when compared with 2019 experience. Despite flood occurrence as reported by many States in the country, dry spell was also experienced especially in the Southern part of the country as indicated in Figure 3.19. It was reported that all local governments areas (LGA) in the Southwest experienced cessation of rainfall between June and August within the year. The dry spell was also reported in Anambra, Enugu and some parts of Imo and Ebonyi States in the Southeast. Edo State was as well affected by the dry spell in South South region. Also, some parts of Kwara, Kogi, Benue, Plateau and Nasarawa States reported cessation of rainfall that affected the growth of crops in the North central. Other LGAs reported to be affected by dry spell were: Obudu, Ogata, Ikom, Bekwama in Cross River State; Karasuwa, Yusufari, Bade, Jakusko, Bursari, Geidam, Yunusari in Yobe State and Argungu, Alairu, B/Kebbi, Augie in Kebbi State.

#### **North-East Zone**

Total amount of rainfall recorded in the zone for 2020 was 5104.0mm which was lower than that of 2019 (5737.7mm) by 12.4 % as indicated in Table 3.1 and Fig 3.1. The first rainfall, was experienced in the month of February in Yobe State and was fully established by May in all the States in 2020. Bauchi State experienced the highest amount of rainfall (1239.0 mm) and highest rainy days (56) in the zone while Yobe had the least rainfall (611mm) and least rainy days (29). The highest total monthly rainfall of 1904mm was recorded in the month of August in 2020 which was lower than 2019 (2386.4mm). The average total rainy days for the zone (251) in 2020 was reported lower than was obtained in 2019 (264) as indicated in Table 3.7. and Fig 3.7.

#### **North-West Zone**

Table 3.2 revealed that Kaduna and Jigawa States experienced first rainfall in March in 2020 and got established in May across the zone. The highest amount of rainfall in the zone was recorded in Kaduna State (1397 mm) while Sokoto State had the least (591 mm). in 2020. All States in the zone experienced higher total rainfall in 2020 except Jigawa when compared with 2019. The average total rainy days for the zone (372) in 2020 was reported lower than was obtained in 2019 (385) as indicated in Table 3.8.

#### **North-Central Zone**

Rainfall commenced in March across the States in 2020, unlike 2019 when the first rainfall was experienced in most States in the zone by February, 2019 as shown in Table 3.3. Nasarawa State experienced the highest amount of rainfall of 1367mm while Niger State had the least (768 mm). The highest total rainfall for the zone in 2020 was recorded in July (2332mm) which was higher than 2019 (2252.2mm). The average total rainy days for the zone was 476 in 2020 was reported lower than was obtained in 2019 (545) as indicated in Table 3.9.

#### **South-West Zone**

Rainfall commenced early in January 2020 in Lagos, Oyo, Ogun and Ekiti States. The rainfall became fully established in the month of March across the States. The month of June recorded the highest total rainfall (3251mm) in 2020 which was higher than 2019 (3075.9mm). Oyo State recorded the highest total rainfall (1346mm) while Ondo State recorded the least (675mm) in 2020 as indicated in Table 3.4. The average total rainy days for the zone in 2020 (587) was lower than in 2019 (776) as indicated in Table 3.10.

#### **South-East Zone**

Anambra State had the highest total rainfall (1977 mm) while Ebonyi State recorded the least (941 mm) in 2020. All States experienced first rainfall by March in 2020 which was contrary to what was experienced in 2019 where most States in the zone witnessed first rainfall in February and indicated in Table 3.5. The month of July recorded the highest amount of (1954mm) in the zone in 2020 which was lower than was obtained in 2019 (2469.3mm). The average total rainy days for the zone was 365 in 2020 and was lower than was obtained in 2019 (442) as indicated in Table 3.11.

#### **South-South Zone**

Cross - Rivers State recorded the highest amount of rainfall (1484 mm) while Akwa- ibom recorded the least (997mm) in the zone in 2020. All States experienced first rainfall in March, 2020 while in 2019 most States in the zone witnessed first rainfall in February as indicated in Table 3.6. The month of July recorded the highest amount of rainfall (3295mm) which was lower than was obtained in 2019 (4119.9mm). The average total rainy days for the zone was 757 in 2020 and was r lower than was obtained in 2019 (907) as indicated in Table 3.12.

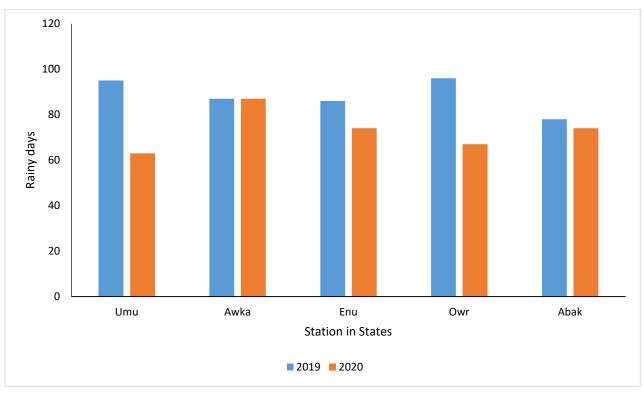

Figure 3.10: South-East Rainy days (Jan – Aug)

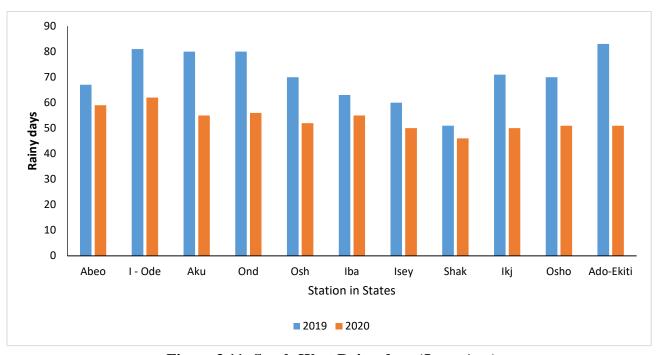

Figure 3.11: South-West Rainy days (Jan – Aug)

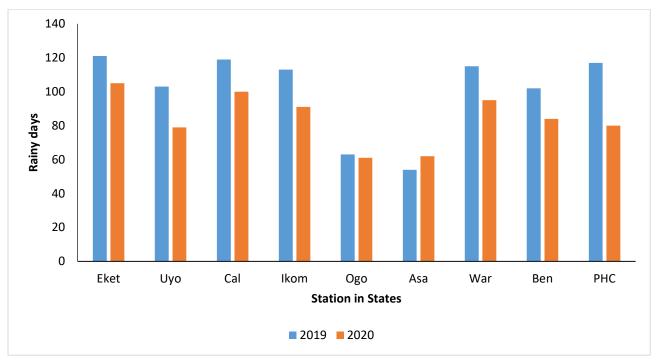

Figure 3.12: South-South Rainy days (Jan – Aug)

#### 3.2: Temperature

Generally, there was increase in temperature in 2020 when compared with 2019 across the country.

#### **North-East Zone**

The highest mean monthly temperature of  $36\,^{\circ}\text{C}$  was recorded in Nguru in Yobe State and Maiduguri in Borno States. The lowest mean maximum temperature occurred in Gombe ( $32.9\,^{\circ}\text{C}$ ) in 2020 as indicated in Table 3.13. The mean temperature for the zone was  $34.64\,^{\circ}\text{C}$  in 2020 which was higher than  $34.29\,^{\circ}\text{C}$  in 2019 as indicated in Table 3.13. The month of April experienced the highest mean temperature of  $39.59\,^{\circ}\text{C}$ , in 2020 which was lower than  $40.72\,^{\circ}\text{C}$  in 2019.

#### **North-West Zone**

Sokoto State recorded the highest mean monthly temperature of 35.3 °C in 2020 while Kaduna State experienced the lowest (31.5°C). The highest average monthly temperature in the zone was 40.01°C in the month of April and the least was 28.75°C in August for the year 2020 as indicated in Table 3.14.

#### **North-Central Zone**

Nasarawa State recorded the highest mean monthly temperature of 34.7 °C in 2020 while the lowest was recorded in Plateau State (28.2 °C). March experiences the highest average monthly temperature (37.56 °C) in 2020, which was higher than 2019 (33.28 °C). August experienced the least (29.27 °C) for the year 2020 as against 29.22 °C in 2019 as indicated in Table 3.15.

#### **South-East Zone**

The highest mean maximum temperature was recorded in Ebonyi (34.3 °C) in 2020 which was higher than 33.9 °C recorded in 2019. The lowest mean temperature was recorded in Imo 32.9 °C) for

2020 as against 31.1  $^{\circ}$ C in 2019. The mean temperature for the zone was recorded as 33.39  $^{\circ}$  C in 2020 which was higher than 32.76  $^{\circ}$ C in 2019 as indicated in Table3.17.

#### **South-West Zone**

The highest mean monthly temperature was recorded at Iseyin, Oyo State (34.8°C) in 2020 which is higher than 32.1°C for 2019. Shaki in Oyo State recorded the least mean temperature of 31.8 °C in 2020. The mean temperature for the zone was reported as 32.76 °C in 2020 which was higher than 32.37 °C in 2019 as indicated in Table 3.16.

#### **South-South Zone**

March recorded the highest monthly temperature  $(38.6^{\circ}C)$  in Cross River State while the lowest was recorded in Akwa-Ibom State as(  $27.0^{\circ}C$ ) in the month of July for 2020. The mean temperature for the zone was reported as  $32.80^{\circ}C$  in 2020 which was higher than  $31.91^{\circ}C$  in 2019 as indicated in Table 3.18.

#### 4.0 USE OF IMPROVED FARM INPUTS

Improved farm inputs were procured and distributed by 28 States and FCT in 2020 across different geopolitical zones of Nigeria as indicate in Tables 4.1 to 4.24. These consist of North East (5), North Central (5), North West (4), South East (4), South south (4) and South west (6) zones. Major inputs procured and distributed by these States include seeds and seedlings, agrochemicals, fertilizer and farm equipment.

Most of the farm inputs procured and distributed were reported to be affordable to farmers except in some States like Katsina, Anambra and Akwa Ibom that reported that seeds and seedlings procured and distributed were not affordable to farmers. Agrochemicals were also reported not affordable in Kwara, Nasarawa, Katsina, and Akwa Ibom.

The inadequacies of farm inputs in most States could be attributed to the COVID -19 pandemic lockdown. Most of the farm inputs procured were likely procured and distributed before the pandemic lockdown. The inadequacies of farm inputs to farmers affects crop situations on the field.

It is recommended that special considerations should be given to agricultural farm inputs, distribution of farm inputs should be decentralized to the grass root level, allowing minimal movements and supply of these inputs to farmers should be timely.

#### 4.1 Seeds and Seedlings Procured and Distributed by States

Major seeds and seedlings procured by 20 States were maize, rice, sorghum, soybean, cowpea, cassava cuttings, pepper, oil palm, plantain and banana. Most of which were affordable but inadequate.

#### **North East Zone**

Adamawa, Bauchi, Taraba and Yobe States were States of the North East that procured seeds and seedlings for their farmers. Seeds and Seedlings procured were maize, rice, sorghum, millet, soybean, cowpea, and sesame. Bauchi, Taraba, and Yobe States distributed all procured seeds and seedlings, except Adamawa that distributed 10 MT out of the 20 MT procured. The source of the seeds and seedlings procured were from private seed companies, Government and Projects.

Table 4.1: Seeds and Seedlings Procured and Distributed by States in the North East Zone

## **North Central Zone**

States in the North Central that procured and distributed seeds and seedlings were Kwara, Plateau, Nasarawa and Benue States including the FCT. The Seeds and seedlings procured were maize, rice, soybean, cowpea, and cotton. All seedlings procured were distributed to farmers, except FCT that was yet to distribute the procured maize and rice seeds. Seeds and seedlings procured was reported to be affordable and inadequate in all States. Sources of these seeds and seedlings were NCRI, IFAD, Premier seeds and Government establishments.

# **North West Zone**

States in the North west zone that reported to have procured and distributed seeds and seedlings are Kaduna, Katsina, Kebbi and Sokoto States. All procurements for seeds of maize, rice, millet, and groundnut were from IAR and ICRISAT.

Katsina procured and distributed 75 MT of cotton seed and 1MT each of millet and maize. Kebbi procured and distributed 40.1 MT of millet and 10MT of maize while Kaduna 20.5MT of maize. Kaduna and Kebbi States both reported that seeds procured and distributed were adequate and affordable to farmers within these States. Details of the seeds and seedling purchased and distributed are indicated in Table 4.3.

Table 4.3: Seeds and Seedlings Procured and Distributed by States in the North West Zone

#### **South East Zone**

As indicated in Table 4.4, the South East States that procured and distributed seeds and seedlings were Abia, Anambra, and Ebonyi. Imo State procured seedlings such as cocoa, cassava, yam, citrus, and oil palm among others. Abia State reported that 120,000 stands of oil palm seedlings procured was affordable and adequate to farmers, hence, 10,000 was distributed. Moreover, 10.9 MT of maize, 92,000 seedlings of fluted pumpkin and 250,000 bundles of cassava bundles were procured and distributed by in Anambra State and were reported as inadequate and unaffordable. Seeds and seedlings procured and distributed by Abia State were reported to be adequate and affordable while in Ebonyi and Imo they were not adequate but affordable. Sources of these seeds and seedlings were Premier seeds, IFAD, Governments and open market.

Table 4.4: Seeds and Seedlings Procured and Distributed by States in the South East Zone

## **South South Zone**

Four States, namely Akwa Ibom, Cross river, Edo, and Bayelsa reported the procurement and distribution of Seeds and Seedlings such as cassava, plantain, banana, cashew, oil palm, maize, rice and soybean as indicated in Table 4.5.

Akwa Ibom, Cross river, Edo, and Bayelsa. Akwa Ibom State reported that 5,000 oil palm seedlings procured and distributed were inadequate and not affordable to farmers. Cross river State procured and distributed 106 MT of rice and 5403 bundle of cassava. Edo State also reported to have procured and distributed maize, rice, soybean, cashew, cassava, plantain and banana were adequate and affordable. Sources of the seed and seedlings were from Governments, IITA, premier seeds, IAR&T and outgrowers.

Table 4.5: Seeds and Seedlings Procured and Distributed by States in the South South Zone

#### **South West Zone**

Ekiti, Lagos, Ondo, Ogun and Osun States procured and distributed rice, maize, cowpea, water melon, onion, pepper, cassava cuttings, plantain, and cashew. Ekiti State procured and distributed 18 metric tons of maize, 30 metric tons of cowpea and 110 metric tons of water melon seeds. They were all reported to be affordable to farmers but inadequate for farmer needs. Lagos State procured and distributed 100 metric tons of onion, pepper and 10,000 seedling of coconut tree. Osun State reported to have procured and distributed 38,000 seedlings of cocoa tree. Seeds and seedlings procured within the South West States were reported to be inadequate except in Ogun where it was reported to be adequate and sourced from seed companies, RTEP, NIFOR, IITA, CRIN, State government and open market. All the seeds and seedlings were reported to be affordable to farmers in all the South West States.

# 4.2 Agrochemicals Procured and Distributed by States

Agrochemicals situation in Nigeria was reported by 23 States who provided agro-chemicals ranging from insecticides and herbicides. Agrochemicals supplied by States were inadequate, though, affordable to farmers. Major sources of these agrochemicals were from private agrochemical companies like Jubaili, WACOT, Springfield, IITA and Government.

#### **North East Zone**

As indicated in Table 4.7, Adamawa, Bauchi, Borno, Taraba and Yobe States reported to have procured and distributed different brands of insecticides, herbicides and inoculants. Adamawa State procured 40,000 litres of herbicides and 20,000 litres was distributed and 11,000 litres of insecticide and fungicides was procured and 5,000 was distributed. Agrochemicals procured by Adamawa State was reported as inadequate but affordable. Bauchi State procured a total of 5000litres of insecticides and 5,000 litres of herbicides which was reported to be adequate and affordable.

On the other hand, Borno and Taraba States procured 5920litres and 8800 litres of herbicides respectively. The agrochemicals procured and distributed by Taraba and Yobe were reported to be inadequate but affordable.

Table 4.7 Agrochemicals Procured and Distributed by States in the North East Zone

NORTH E	EAST ZONE

#### **North Central Zone**

Different brands of agrochemicals were procured and distributed in the States in the North Central zone. were different brands of insecticides and herbicides as indicated in Table 4.8. States that procured and distributed agrochemicals in the North Central are Kwara, Nasarawa, Benue States and FCT. Litres of agrochemicals procured and distributed are between 75 litres and 7,000 litres. Agrochemicals procured by FCT were yet to be distributed during the time of this survey. Source of agrochemicals were from private companies and ARDS.

Table 4.8: Agrochemicals Procured and Distributed by States in the North Central Zone

NORTH CI	ENTRAL ZONE						
State	Agrochemical Class	Name	Quantity Procured	Quantity Distributed	Adequacy	Affordability	Source
		Paraquat	3,125 L	Yet distribute	-	-	ARDS
FCT	Herbicide	Propercare	490 L	Yet distribute	-	-	ARDS

		ATTACK	3,500 L	3,500 L	No	Yes	Private

#### **North West Zone**

Only 2 States in the zone namely Katsina and Sokoto States procured and distributed agrochemicals. Sokoto and Katsina States procured and distributed 2000litres and 3500litres of insecticides respectively. Sokoto State also procured and distributed 3000litres of herbicide.

Agrochemicals procured and distributed by the two States were reported as not being adequate, but affordable only in Sokoto State as indicated in Table 4.9.

Table 4.9: Agrochemicals Procured and Distributed by States in the North West Zone

NORTH V	NORTH WEST ZONE											
State	Agrochemical Class	Name	Quantity Procured	Quantity Distributed	Adequacy	Affordability	Source					
Katsina	Insecticide	Insecticide	2,000 L	2,000 L	no	No	Government					
Sokoto	Insecticide	Insecticide	3,500 L	3,000 L	No	Yes	Agro Corp. Coy					
	Herbicide	Herbicides	3,000 L	2,800 L	No	Yes	Agro Corp. Co					

## **South East Zone**

Ebonyi State was the only State reported to have procured and distributed agrochemicals in the South East zone. Some selective herbicides (200,000 L) and non selective herbicide such as glyphosate (300,000 L) were procured and distributed to farmers within the State. They were reported to be inadequate and affordable. The source was from IFAD.

Table 4.10: Agrochemicals Procured and Distributed by States in the South East Zone

SOUTH E	SOUTH EAST ZONE											
State	Name	Input Type	Quantity Procured	Quantity Distributed	Adequacy	Affordability	Source					
Ebonyi	Herbicide	Selective Herbicide	200,000 litres	200,000 litres	No	Yes	IFAD					
		glyphosate	300,000 L	300,000 L	No	Yes	IFAD					

## **South South Zone**

Akwa Ibom, Cross river and Edo States were the only States in the South south zone that procured and distributed different brands agrochemicals. Edo State procured and distributed 4 brands of herbicides totalling 84,465 litres. These herbicides were reported to be adequate and affordable to farmers within the States. The source of the agrochemicals in the zone was Jubaili, WACOT and Governments as indicated in Table 4.11

Table 4.11: Agrochemicals Procured and Distributed by States in the South South Zone

# **South West Zone**

As indicated in Table 4.12, all States in the South West zone procured and distributed agrochemicals. Oyo State procured and distributed the highest quantity of herbicides and pesticides which was 24,600 litres compared with Ekiti State that procured and distributed 7,000 litres and 1000kg of herbicides. Lagos State procured and distributed 4800liters of herbicides These agrochemicals were reported not being adequate but affordable in the States and sourced from open market and Governments.

# 4.3 Fertilizer Situation by States

Fertilizer procurement and distribution in many States of Nigeria were reported to be reducing every year. Twenty-four (24) States were observed to report fertilizer situation across Nigeria. Fertilizers procured and distributed were NPK, Urea, SSP and liquid fertilizers in some States. Sources of procurement of most of these fertilizers were Governments, Rice Farmers Association of Nigeria (RIFAN) and open markets.

#### **North East Zone**

Adamawa State reported the highest quantity of NPK fertilizer (13,000 MT) procured and distributed to 450,000 farm families. Bauchi State procured 3900 MT of NPK and distributed 3,000 MT. Gombe State procured and distributed 10,000 MT of NPK and Urea fertilizers. Most of the fertilizers procured and distributed in the North East zone was sourced by the State Governments.

**Table 4.13: Fertilizer Situation by States in the North East Zone** 

NORTH EAST	T ZONE				
State	Fertilizer Type	Quantity Procured ('000 MT)	Quantity Distributed ('000 MT)	No. of Farm Families Benefited	Source

NA= Not available

## **North Central Zone**

FCT, Kogi, Nasarawa, Niger and Benue States were North Central States that procured and distributed fertilizers to farmers in the zone. Kogi State procured 90,000 MT, 90,000 MT and 80,000 MT of NPK, Urea and SSP respectively while 60,000 MT, 70,000 MT and 80,000 MT were distributed to 2,000, 1800, and 1,500 farm families respectively. Fertilizers procured by the FCT was yet to be distributed to farmers at the time of the survey. This might be associated to lock down during the COVID- 19 pandemic. The Federal Government of Nigeria sourced the fertilizers for FCT while the State Government sourced for their respective States.

**Table 4.14: Fertilizer Situation by States in the North Central Zone**

	Urea	5	5		State State Govt.			
Benue	NPK	2.76	2.76	34,500	FGN			

#### **North West Zone**

The States reported to supply fertilizer in the north west zone were Kebbi, Sokoto and Zamfara. Fertilizers procured and distributed to farm families were NPK and Urea. About 210,000 farm families benefitted from these fertilizers. Sokoto procured and distributed 12,000 MT of NPK fertilizer to 3,000 farm families while Zamfara State reported 150,000 MT of NPK distributed to 200,000 farm families.

Table 4.15: Fertilizer Situation by States in the North West Zone

#### **South East Zone**

Anambra and Abia States procured and distributed 8,400 MT and 5,400 MT of NPK and Urea fertilizers respectively. Imo State had a Public Private Partnership arrangement with a private company to supply 4,500 MT of both NPK and Urea that was distributed to 303, 333 farm families. The source of these fertilizers was from State Governments.

Table 4.16: Fertilizer Situation by States in the South East Zone

#### **South South Zone**

In the South South zone, Cross river, Delta and Edo States procured and distributed NPK, Urea, SSP and Organic fertilizers. Cross river State procured the highest quantity of NPK and Urea which are 6,500 MT and 5,000 MT and 4,500 MT was distributed respectively. The source of the fertilizers procured and distributed were from Governments and RIFAN.

**Table 4.17: Fertilizer Situation by States in the South South Zone**

## **South West Zone**

Ekiti, Lagos, Ogun, Ondo, and Osun States procured and distributed NPK, Urea and Organic fertilizers. Ekiti State procured 102,000 and 306,000 MT of NPK and Urea fertilizers and distributed 100,000 and 300,000 MT respectively for 250 farm families. Osun State procured 5,000 MT of NPK fertilizer from the Federal Government of Nigeria and distributed them to 5,000 farm families. Lagos, Ondo, Ekiti and Ogun States sourced their fertilizer form the State Government.

# 4.4 Farm Equipment Procurred and Distributed by States

Farm equipment was reported to be procured and distributed by 25 States in Nigeria. Among the equipment procured and distributed were Tractor, Draught implements, Agro-processing equipment, power tillers and reapers.

## **North East Zone**

Adamawa State procured 105 tractors which were distributed to all LGAs in the State. Other farm equipment purchased by Bauchi State included 200,000 draught implements of which 100,000 were distributed. Bauchi State procured and distributed 2,400 Ox-drawn ridger. Yobe on the other hand purchased and distributed 36 tractors and 5 treashers. The farm equipment procured were reported to be inadequate for farmers in the States.

Table 4.19: Farm Equipment Procured and Distributed by States in the North East Zone

NORTH E	NORTH EAST ZONE							
State	Farm Equipment Type	Equipment Name	Quantity Procured	Quantity Distributed	Adequacy Yes / No	Number of Beneficiaries

# **North Central Zone**

Nasarawa, Niger and Benue States reported procurements and distribution of some equipment such as sprayers, tractor, bulls, draught implement, threshers, power tillers and reapers. Nasarawa and Niger States procured 1,950 and 11 knapsack sprayers respectively and distributed same. Benue State however, procured and distributed 145 tractors, 20 Animal drawn ridgers, 45 motorized threshers and 30 power tillers as indicated in Table 4.20

Table 4.20: Farm Equipment Procured and Distributed by States in North Central Zone

NORTH CH	NORTH CENTRAL ZONE

	Reapers	12 HP & 8 HP	35	30	no	-			

# **North West Zone**

Farm equipment purchased and distributed by States in the zone include tractors, draught implements, and sprayers. Jigawa State purchased and distributed 50 tractors and 500 sprayers as against 124 and 150 sprayers purchased and distributed by Katsina and Sokoto States respectively. Kebbi on the other hand, purchased and distributed 100 tractors. All the equipment purchased and distributed were reported as not being adequate.

NORTH V	NORTH WEST ZONE

# **South East Zone**

Table 4.22 shows that Abia State procured tractors, bulldozers, grader, and payloader for use within the State. Also, Ebonyi State procured and distributed 10 tractors and 15 combine harvesters for same number of farmers in the State. Imo State procured and distributed some processing equipment like melon peelers, and oil palm processing machines.

Table 4.22: Farm Equipment Procured and Distributed by States in the South East Zone

# **South South Zone**

Akwa Ibom, Cross river, Delta, Edo, and Bayelsa States procured and distributed some farm equipment. Cross river State procured and distributed 1000 pieces of water pump, Akwa ibom State procured 20 tractors of various brands for use within the State. Edo State on the other hand arranged with some private companies on a Public Private Partnership (PPP) to procure and distribute tractors andtheir implements to more than 3,000 beneficiaries as indicated in Table 4.23.

Table 4.23: Farm Equipment Procured and Distributed by States in the South South Zone

Lagos State procured 500 sprayers and 50 smoking kiln but distributed 215 sprayers and 25 smoking kilns to farmers within the State. Ogun State procured 7 tractors of which 221 benefited from the tractor services. Ondo State also procured 20 tractors but distributed 19 tractors including their implements. Osun State on the other hand purchased and distributed 200 sprayers as indicated in Table4.24.

## 5.0 CROP PESTS AND DISEASES

Incidence of pests and diseases was reported in more than 30 States across the country. Cases of these pests and diseases severity were reported to be between light and moderate in severity. The prominent pests and diseases of tuber crops reported were mosaic, leaf wilts, bacterial blights, rodents and birds with an estimated yield loss of 30 %. Cereals and legumes were generally infested with army worm, stem borers, pod borers, and birds. Fall army worm was reported in all the States with an average yield loss of about 45 %. Control measures undertaken to contain the pests and diseases infestation generally were use of agro-chemicals, Good Agricultural Practices (GAP), integrated farming, destruction of bird nests, cultural control methods and use of hermetic storage bags in the control of storage insect pest. Major challenges faced with the control of these pests and diseases control, were unavailability and high cost of recommended agro-chemicals and adulteration of the available agro-chemicals.

# **5.1 Tuber Crops**

Table 5.1 shows the incidence of pests and diseases in tuber crops. Tuber crops such as yam, cassava, sweet potato and cocoyam were reported to be infested by various pests and diseases as indicated in Table 5.1. Prominent among these pests and diseases are nematodes, rodents, mosaic, beetle, leaf spot, storage rot, mealy bug and virus. States that reported these infestations are Nasarawa, Imo, Kogi, Taraba, Oyo, Ekiti, Abia, Akwa Ibom, Osun, Ondo, Lagos, Enugu, Adamawa and the FCT. The severity of these pests and diseases were reported to be between light and heavy.

Yam Spittle bugs was reported to be heavy in Taraba State and yam mosaic was reported to be mild in Kogi State with 30 and 50 % expected yield loss respectively.

Cassava leaf spot was reported to be heavy in Osun State while cassava mosaic and Cassava Bacterial Blight (CBB) were reported mild in Adamawa and Kogi States. The reported percentage yield loss experienced in Osun State was 20 %, while in Adamawa and Kogi it was estimated to be 10 % and 50 % respectively. Though, the 50 % yield loss reported in Kogi State was mild and 20 % yield loss in Oyo State were also both mild for CBB. These high losses might be attributed to late identification of the pests and diseases and the late control measures undertaken. Cassava tuber rot was another major disease that was reported to cause 57 % and 20 % yield loss in Lagos and Ondo State respectively. Leaf spot and storage rot are pests and diseases of sweet potato reported in Osun State. The infestation was mild and heavy with 10 and 20 % yield loss respectively.

Cocoyam diseases were reported in Ondo, Imo, Kaduna, Enugu, Ekiti, Akwa Ibom and Osun States. Heavy severity of Fungal disease was reported to occur in Enugu which might result in 55 % yield loss. Cocoyam root diseases and root rot were reported in Kaduna and Osun State with estimated 20 and 10 % yield loss respectively.

# **5.2** Cereals and Legumes

Table 5.2 shows the Incidence of Pest and Diseases in Cereals and Legumes crops. Maize is one of the major crops planted in Nigeria. The common maize pests and diseases observed during the 2020 Agricultural Performance Survey (APS) were Fall army worm, maize streak, locust, stem borer, spittle beetle, leaf miners, leaf blight, striga, bacterial stalk roy, rodents/pests, weevil, and leaf curl. These pests and diseases were found in almost in all States of Nigeria.

Fall army worm was an insect pests observed to affect maize plant in almost all States across Nigeria. The severity of the pests was reported to be between mild and heavy in all States. Abia, Kogi, Kwara, Ondo, Kaduna, Enugu, Benue, Osun reported yield loss of between 20 % and 50 %. Other States reported below 20 % yield loss. Control measures undertaken were use of chemicals, cultural controls, biological methods, Good Agricultural Practices (GAP), seed dressing and use of PIC storage bags.

Rice is another cereal crop planted in most States of Nigeria. Pests and diseases reported to affect rice this year were mole cricket, rodent, rice blast, fungal and bacterial blight, birds, stem borer, white head, white flies, brown leaf spot, grass cutter, and leaf folder. States that reported one or more of these pests and diseases infestation were Nasarawa, Imo, Borno, Niger, Edo, Ogun, Kogi, Plateau, Bauchi, Taraba, Oyo, Kano, Ebonyi, Ekiti, Abia, Benue, Gombe, Adamawa, Kwara and FCT. Rice blasts affects rice field across many States. The severity reported were

between mild and moderate with yield loss experienced in the following States were Kogi -30 %, Ekiti, Ebonyi and Edo -25 %, Bauchi -15 %, Adamawa, Plateau and Borno -10 %. Control measures employed against the spread of rice blast were use of resistance varieties, use of chemicals, practice of integrated farm management, bird scaring and nest destruction and Good Agricultural Practices (GAP).

Cowpea was reported to be infested by pests and diseases in Nigeria. Few among the pests and diseases that affected cowpea were pod borer, brown rust, aphids, weevil, grass hopper and striga. States that reported these pests and diseases were Ondo, Katsina, Imo, Borno, Kogi, Yobe, Oyo, Ekiti, Abia, Benue, Adamawa and Osun States. Pod borers was reported in Kogi State with 50 % yield loss, Yobe had 40 %, Oyo - 30 %, Ekiti - 25 %, Osun, Borno and Abia States reported 10 % yield loss respectively. Control measures taken were use of chemicals, hermetic storage and resistant varieties.

Sorghum pests and diseases reported across Nigeria are striga, sorghum smut, army worm, downy mildew, stem borers, short flies, and qualia birds in Katsina, Borno, Zamfara, Bauchi, Yobe, Adamawa and Benue State. Severity were of these pests and diseases were reported generally as light with percentage yield loss of between 10 - 14 %. However, Yobe State reported a moderate case of downy mildew that resulted in a yield loss of 30 %.

Millet was reported to be mainly affected by birds and army in Katsina, Borno, Zamfara, Bauchi, Yobe and Benue resulting in yield loss of 25 %. Case of army worm infestation reported in Katsina was moderate but experienced a yield loss of 22 %. Control measures taken were use of insecticides and scaring away the birds.

Groundnut cultivated in Katsina, Borno, Zamfara, Bauchi, Taraba, Oyo, Ekiti, Abia, and Benue States were reported to be infected with insect pod, groundnut root rot, pod borer, curly leaves, millipedes, aphids, nematodes, termites and rosette. The severity of these pests and diseases were between light and moderate. However, cases of insect pods in Benue was reported to have a yield loss of 50 %, Curly leaves in Oyo State had 30 % yield loss, Millipedes infestation in Taraba had 25 % yield loss and Aphids infestation on groundnut in Bauchi, Zamfara, and Katsina all had 10 % yield loss.

**Table 5.2: Incidence of Pest and Diseases in Cereals and Legumes**

# **5.3 Fruits and Vegetables**

Tomato was the only fruits and vegetables reported to be infested by pests and diseases in some States of Nigeria. Tomato wilts, Nematode, Flies, Bacterial wilt, Fusarium wilt, Fruit worm, Blight, Leaf hoppers, and Wilting were pests and diseases reported to affect tomato fruits in Ondo, Borno, Edo, Oyo, Zamfara, Kogi, Osun and Ekiti States. Fusarium wilt was reported in Kogi State with an estimated 40 % loss. Tomato wilts and Nematodes were reported in Edo and Osun States with 80 % and 20 % yield loss respectively. Details are indicated in Table 5.3.

It was generally observed that cases of pests and diseases in Nigeria were between light and moderate cases and yield loss were reported to be between 10 - 60 %. Control measures used ranges between use of chemicals, biological controls, cultural controls, traps, Good Agricultural Practices (GAP), PIC storage bags, and resistant varieties among others.

## **6.0 AGRICULTURAL MECHANIZATION**

Agricultural mechanization is the deployment and use of labour-saving devices and machines in place of human labour for agricultural production, processing, handling, preservation and storage. Agricultural mechanization reduces drudgery, improves timeliness and efficiency of various agricultural operations and generally increases productivity per agricultural worker.

Small-scale peasant farmers, who are a dominant majority of Nigerian farming population, still depend on manual labour for most of their farming operations and activities. However, with labour demand peaks at critical crop production periods, high labour cost and relative scarcity makes the introduction of mechanization to Nigerian agriculture more inevitable than ever before.

# **6.1 Tractor Availability and Functionality**

Tractor is the most common agricultural mechanization machine used in Nigeria. Data on available tractors and their functionality were collected from all ADPs, ministries and the FCT nationwide. The total number of functional government tractors as captured for the country in 2019 and 2020 were 1,534 and 642 representing a decrease of 58.39%. These figures depict a gross under reporting of the tractor population in the country. Many States did not provide the necessary data. For the private sector, available functional tractors were 2,053 and 2,205 in 2019 and 2020 respectively, an increase of 7.40%. The number of non-functional tractors reduced by 25.06% from 403 in 2019 to 302 in 2020 suggesting an improved management of tractors in 2020.

Table 6.1 gives the number of tractors available in the North East agro-ecological zone. Adamawa State reported the highest number in the zone (105) in 2020 followed by Bauchi (15) and Yobe (15), while Borno and Gombe had 12 and 10 respectively. There was a decrease of 21.89% in the number of functional government tractors in the zone.

The number of private tractors in the zone were not provided by the States ADPs and Ministries of Agriculture in the zone except Bauchi that posted 241 functional and 44 non-functional private tractors in 2020.

<sup>\*</sup> Additional information obtained after 2019 report

Table 6.2 gives the number of functional and non-functional tractors for both government and the private sector in the North West zone. The zone reportd 100 functional government tractors for 2020, a reduction of 74.35% from the 2019 figure. The private sector however reported 1,061 tractors in 2020, an increase of 59% over 2019.

Within the zone, Kebbi State reported the highest number of government tractors (100) in 2020. It was observed during the survey, that 100 government tractors purchased more than 3 years ago were still lying idle, undistributed and unused. Kaduna State has the highest number of functional private tractors (1,061) in the zone, an increase of 59.31% over 2019.

Table 6.3 shows the State of government and private tractors in the North Central zone. The number of functional government tractors reported in 2020 was 293 as against 803 in 2019 indicating a reduction of 63.51%. The States worst hit in reduction of government functional

tractors were Plateau and Kogi with 60.55% and 60% respectively. In the same vein, the number of functional tractors in the private sector reduced over the period by 35.58% across the region. Plateau State recorded the highest reduction (92%). Kwara State reported the highest number of private tractors (727) in the region for 2020.

<sup>\*</sup> Additional information obtained after 2019 report

Table 6.4 gives the number of available functional and non-functional tractors for government and private sector in South West zone. The number of tractors reported available in the zone was significantly lower than expected for both 2019 and 2020. Data received showed a reduction in number of available government tractors for all the States in the zone for 2020 when compared with 2019. Some of the percentage reduction were Oyo (91.66%), Ondo (66.66%) and Ogun (56.6%). In the private sector, only Osun State posted data of 27 functional tractors.

<sup>\*</sup> Additional information obtained after 2019 report.

The number of available government and private tractors in the South East zone are given in Table 6.5. Ebonyi State reported 30 functional government tractors in 2020, 40% less than the 2019 figure. The number of government functional tractors in Imo and Enugu State increased in 2020 by 600% and 40% respectively compared to 2019. The information on the availability of private functional tractors in the zone was only provided by Ebonyi (14) and Enugu (13) States. Generally, the number of government functional tractors reduced by 37.87% between 2019 and 2020.

<sup>\*</sup> Additional information obtained after 2019 report.

The South-South agro ecological zone recorded low number of government functional tractor in 2020 (29) compared with 2019 (33), the reduction in number of government functional tractors was 12.12%. Generally, the zone recorded low functional available tractors in both government and private sector as shown in Table 6.6. It's high time for the government of various State within the zone to assist farmers by making provision of farm equipment to reduce the drudgery in farming. The data available from ADPs and State Ministries basically reflects government owned tractors. It was generally observed across the States that, the use of government tractor for agricultural mechanization was not encouraging, especially, the number of non-functional tractors that has been increasing yearly.

<sup>\*</sup> Additional information obtained after 2019 report.

The South-South agro ecological zone recorded relatively low numbers of government functional tractors in 2020(29) compared with 2019(33). Governments of the various States in the zone are encouraged to assist farmers through provision of farm equipment to reduce the drudgery in farming.

The data available from ADPs and State Ministries basically reflect government-owned tractors. It was generally observed across the States that the number of non-functional tractors has been increasing yearly. Data were not available on private tractors in most of the States. However, a private organization, Tractor Owners and Hiring Facilities Association of Nigeria (TOHFAN), reported having five hundred and fifty-six (556) tractors in their fleet with a Tractor calendar that covers 31 States in Nigeria for both wet and dry seasons farming.

Plate 6.1: Newly acquired Tractors by Delta State Governmentt.

## **6.2 Animal Traction**

Animal traction is the use of some select animals (Bull, donkey and camel) for provision of draft power for agricultural activities like ploughing, harrowing, ridging, transportation, etc. Animal traction has played and still plays an important role in meeting the power requirement for agricultural purposes in Nigeria. The technology is mostly applied in the Northern part of Nigeria where the soils are lighter and incidence of Tse-Tse fly is negligible. The problems of incessant cattle rustling and insecurity had also affected the animal traction use in many parts of the country like Borno, Zamfara, Katsina, Kaduna and Yobe.

Table 6.7 and Figure 6 give the available data for 2019 and 2020 on the number of working bulls in some State. Adamawa has the highest number of bulls (200,000) in 2020 while Kebbi had 250,000 in 2019, although no data was provided for 2020. Gombe State reported a giant leap in the number of work bulls from 695 in 2019 to 6,150 in 2020.

**Table 6.7 Animal Traction situation in some States** 

S/no.	State	2019	2020	% change

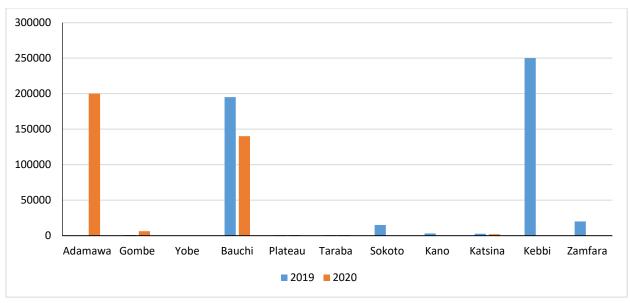

Figure 6.1: State of Animal Traction in Nigeria, 2019 to 2020.

# 6.3 Cost of Tillage Operation

Tillage is the mechanical manipulation of soil with tools and implements for obtaining conditions ideal for seed germination, seedling establishment and growth of crops. Tillage operations include land clearing, ploughing, harrowing and ridging. The cost of tillage operations in the country as reported by the States in 2020 is presented in Tables 6.8 to 6.13.

Plate 6. 2: Ploughs procured for tillage operation.

The cost of tillage operations in the North East zone is presented in Table 6.8. It was observed that in 2020 the cost of land clearing, ploughing, harrowing and ridging in Adamawa State increased generally as against 2019 by percentage changes of 36.3, 25, 26 and 50% respectively.

Bauchi State recorded increase in the cost of ploughing, harrowing and ridging with percentage change of 13.3, 50, and 60% respectively but the cost of land clearing remains the same. There was a general increase in tillage operations in Borno, Gombe, and Yobe with Gombe having the highest percentage change of 20, 100, 87.5 and 25% for land clearing, ploughing, harrowing and ridging respectively.

In the North West Zone, there was increase in the cost of land clearing in Kaduna, Kebbi, Sokoto and Zamfara. No records were posted for the cost of land clearing in Kano and Jigawa States. However, there was increase in cost of ploughing in 2020 as compare to 2019 generally in the zone except in Jigawa, with Kano having the highest percentage change while Kebbi State had the least of 5% change. Cost of harrowing operation increased across the zone except in Katsina and Zamfara. The percentage changes for Jigawa, Kaduna, Kano, Katsina, Kebbi, and Sokoto were 33.3, 4.17, 25, 6.25 and 50% respectively. Cost of ridging also increased in Kaduna, Kano, Katsina and Kebbi with percentage changes of 25, 87.5, 25 and 6.25% respectively, but the cost was the same in Jigawa, Sokoto and Zamfara.

There was no data for the cost of land clearing in Kwara; while Benue, Kogi, and Plateau recorded decrease in the cost of land clearing with percentage changes of -27.27, - 4, -10% respectively. Highest cost of ploughing, harrowing and ridging were obtained in Niger State with percentage change of 66.67, 200 and 150% at NGN30,000/ha, NGN30,000/ha and NGN25,000/ha respectively.

Cost of tillage operation for South West zone is presented in table 6.11, the cost of land clearing decreased in Ondo State with percentage change of -16.67%. There was no data recorded in Ekiti State, however cost of land clearing increased in Lagos, Osun and Oyo States with percentage changes of 50, 28 and 20% respectively. Cost of ploughing in 2019 and 2020 was the same in Ondo and Oyo but there was an increase in Ekiti, Lagos and Ogun with percentage changes of 1.35, 60 and 25% respectively while Osun recorded a decrease with percentage change of -37.5%. Similarly, the cost of ridging in Ondo and Osun also decreased with percentage change of --6.67 and -37.5 while in Oyo the cost was the same in 2019 and 2020 but Ekiti, Lagos and Ogun recorded an increase with percentage change of 4, 25, and 20% respectively.

In South-South Zone the highest cost of land clearing was recorded in Rivers State with percentage change of 50% followed by Akwa-Ibom with percentage change of 13.3%. Cost of ploughing in 2019 and 2020 was observed to be the same in Edo and Ekiti but there was an increase in Akwa-Ibom with percentage change of 8%. The cost of harrowing increased in Akwa-Ibom, Edo and Rivers with percentage changes of 8, 50, and 12.5% respectively. There was no change in cost of Ridging in Edo for both 2019 and 2020 but Akwa-Ibom recorded an increase of 8% while Rivers State recorded a decrease of 12.5%.

In the South East, the cost of land clearing in 2019 and 2020 was the same in Ebonyi and Enugu but Abia and Imo recorded a decrease with percentage change of -16.7 and -37.5% respectively. However, there was an increase in cost of ploughing in Ebonyi with percentage change of 25% but there was no difference in ploughing cost in Abia and Enugu for both 2019 and 2020 while Imo recorded a decrease with a percentage change of -11.8%. The cost of harrowing was observed to increase in Ebonyi and Enugu with a percentage change of 12.5 and 16.7% respectively. The highest cost of ridging was obtained in Abia with percentage change of 38.8%.

# **6.4 Agro-Processing Centres in Nigeria**

Crop processing is a crucial step in converting raw harvested agricultural produce into valuable marketable products. This can be done either traditionally or with modern technology. Primary processing of crops includes threshing, shelling, and winnowing while the conversion of crops from their original form to another form like cassava flour, maize flour, etc. are secondary processing. Tables 6.14 to 6.19 show available processing Centres across the country, their locations, types of crop processed and their capacities. Processing plants available in the North East as presented in table 6.14 are situated in Bauchi, Gombe, and Yobe. Predominant crops processed are Maize, Rice, Sorghum, Cassava and ground nut with operating capacity ranging between 25 to 500MT/day.

Plate 6.3: Mechanical method of threshing crop.

**Table 6.14 Processing Plants in North East Zone**

Information provided on processing Centres in North West as presented in Table 6.15 indicates that predominant crops processed are rice, ground nut, cotton and sugarcane. Kebbi and Zamfara States have the same number of processing (6) Centres with operating capacities between 16 and 30MT/day while Jigawa State was reported to have just one processing centre.

In the North Central, processing Centres were available at Abuja, Benue, Kogi, Kwara, Nasarawa, Niger Plateau and Taraba States with operating capacity between 2 to 90MT/day. The major crops processed were Rice, Cassava, Yam and Soybean. Benue State has the highest number of processing Centres in the zone.

Processing plants available in the South West as presented in table 6.18 are situated in Ekiti, Lagos, Ogun, Ondo, Osun and Oyo States. The major crops processed are Rice, Cassava, Oil palm and Cocoa with operating capacity between 1 to 2400 tonnes/day. Ekiti and Ogun have the highest number of processing Centres.

In the South-South, processing Centres were located in Akwa-Ibom, Bayelsa, Cross River, Delta, Edo and Rivers States with operating capacities between 1 to 240MT/day. The predominant crops processed were Yam, Plantain, Rice, Cassava, Cocoa, Oil palm and Potato. Edo State has the highest number of processing plant in the zone.

## **6.5** Grain Reserves

Grains are stored in both traditional and modern storage structures which include rhumbu, barns and silos. Silos of varying storage capacities have been constructed in various locations across the country for the strategic grain reserves initiative of the government. The locations, storage capacity and functionality status of the government silos are presented in Tables 6.20 to 6.25. Apart from the silo complexes and their capacities provided by the Food and Strategic Reserves Department of the Federal Government, some States also have some silos where grains are reserved in their States to compliment the effort of the federal government.

Figure 6.4: Traditional Storage Structures for Storing Grain.

In the North East, four States have functional strategic grain reserves as presented in Table 6.20. The storage capacity ranges between 4000 to 25,000MT, the crops stored are Maize, Sorghum, and Millet. Information provided on the strategic grain reserve in the North West is presented in Table 6.21. The seven States in the Zone had Strategic grain reserves with storage capacity ranging between 1500 to 100,000MT. The data obtained revealed that six out of the seven grain reserves are functional while the functionality status of the Zamfara grain reserve was not provided. Grains stored are Maize, Millet and Sorghum. In the North Central, strategic grain reserves are located in Abuja, Benue, Kogi, Kwara, Nasarawa, Niger and Plateau. The storage capacity ranges between 4000 to 25,000MT and the crops stored are Maize, Gari and Sorghum.

Plate 6.5: Silo for grain reserve.

Table 6. 20: Silo Complexes and their Capacities in North East Zone

Niger	Minna	25,000	Maize	Functional
Plateau	Jos South	25,000	Maize	N/A

Anambra, Ebonyi and Imo in the South East were reported to have functional grain reserves with storage capacity ranging between 25,000 to 100,000MT. Table 6.24 provides information on strategic grain reserves in South West Zone. The five silo complexes reported were all functional and the crops stored were Gari, and Maize. In the South South, there was no information provided for Delta and Rivers but the remaining four States had functional strategic reserves of storage capacity between 25,000MT to 100,00MT.

Table 6.23: Silo Complexes and their Capacities in South East Zone

## 7.0 COST OF PRODUCTION OF MAJOR CROPS

The cost of production per hectare for cereals, legumes, roots tubers, fruits and vegetables crops in all States across the six (6) agro-ecological zones are captured in this report. The crops captured were categorized into Cereals and Legumes (rice, maize, sorghum, millet and cowpea, soybean, groundnut, melon, Bambara nut, Beniseed), Roots and Tubers (cassava, yam, cocoyam, sweet potato, ginger, cocoa and oil palm), Fruits and Vegetables (tomatoes, pepper, plantain/banana, okra, citrus and leafy vegetables). The cost of producing these aforementioned crops was calculated in Naira (N) per hectare (Ha), with percentage (+%) increase or (-%) decrease from 2019 wet season.

# 7.1 Cereals and Legumes

Cereals and legumes are generally cultivated in Nigeria for the edible components of their grains. They have the tendencies to be cultivated under both rain fed and irrigated farming for consumption, livestock forage and silage, and as soil-enhancing green manure. Cereal crops captured in the 2020 APS survey are presented below:

## **North-Central Zone**

In this years' wet season, the cost of producing cereal crops have generally increased in all States of the North-Central Zone with the exception of Plateau State and FCT that recorded - 39.7% and -28.1% decrease in the cost of producing maize (Table 7.1). Among all States in the zone Benue and Nasarawa State recorded the highest increase in the cost of production.

#### **North-East Zone**

The cost of producing maize, cowpea, groundnut, rice, sorghum, soybean, millet and Beniseed have generally increased in the North-east zone when compared with what it was obtained in 2019 wet season. Exceptionally Borno State reported a decrease in cost of producing cowpea and millet by -52.7% and -52.0% (Table 7.2) and sorghum by -33.6% in Bauchi State. Adamawa, Gombe and Yobe States recorded the highest increase in the cost of producing cereal crops across the zone. The increase in cost of production in 2020 was attributed to increase in the cost of inputs due to high demand and shortage of supply caused by the restrictions of the COVID-19 pandemic.

#### 7.1.3 North-West Zone

The average cost of producing cereals and legumes have generally increased in the north-west zone as indicated by the percentage change between 2019 and 2020. Jigawa and Kaduna States recorded a percentage decrease in the cost of production (Table 7.3). This was influenced by certain factors such as; increase in the cost of production inputs, caused by shortage of the inputs supply due to COVID-19 lockdown policy. Kano, Katsina and Kebbi States recorded the highest increase in cost of production in 2020 over 2019.

## **South-East Zone**

The average cost of producing the major cereals (maize and rice) in the South-East was №273, 796 and №369, 854 in 2019 as compared to №292, 883 and №397, 688 in 2020 with a percentage decrease of about -8% for maize and increase of about 44% for rice (Table 7.4).

Notably, there was a high percentage increase in the cost of producing maize in Abia State while there was no change in the cost of rice production. Imo State thus reported a significantly high percentage change in the cost of producing rice (167%). Reportedly caused by movement restrictions of the COVID-19 pandemic. the change of cost of production of Beniseed and groundnut was between 33% and 36% in Ebonyi State.

## **South-South Zone**

The cost of producing cereals and legumes in the South-South zone increased in 2020 except in Edo State (Tables 7.5) with percentage decrease change of -4% for maize production, -14% and -30% for rice and soybean production. The percentage change for rice in Rivers was pointedly high 50% and remains high for maize (77%) and cowpea (56%). On the average the zone recorded an increase in the cost of production of maize (23%), rice (21%) and cowpea (21%). The resultant increase was also due the unavailability of production inputs especially fertilizer blamed on the complete lockdown of the country.

#### **South-West Zone**

Two States in the South-West (Ogun and Ondo States) reported a decrease in cost of producing maize with percentage change of -3% and -88% in 2020 when compared to 2019 (Table 7.6). While rice recorded an increase in cost of production with a percentage change of 9% except Ogun State (-2%). On the average, the whole zone experienced a percentage decrease change of about -4% (maize) and an increase change 9% (rice). On the other-hand deceasing change of cost of cowpea production was only indicated in Ogun State (about -3%), while the average change remained at 4% in the zone.

#### 7.2 Root and Tubers

Roots and tubers are second most important crops after cereals in Nigeria. They are important staple source of energy. The crops considered include; Cassava, Yam, Cocoyam, Sweet potato, Ginger, Cocoa and Sugar cane.

## **North-East Zone**

The root and tuber crops observed in north east region in 2020 are mainly Cassava and Yam. The data reveals a percentage increase in the cost of producing Cassava and Yam in 2020 with the exception of Adamawa State that recorded a percentage decrease of -3.7% in Yam production. Borno, Gombe, and Yobe States have not recorded any data on both Cassava and Yam production cost (Table 7.7)

#### **North-Central Zone**

The result reveals a percentage increase in the cost of producing cassava and yam in 2020 except for Kogi and Kwara States that experienced a decrease in the cost of producing cassava in 2020 as compared to 2019 (Table 7.8). Nasarawa State recorded no change in the cost of production for yam and cassava. Some of the States in the zone have not reported any data for cocoyam, potato and sugarcane

#### **South-East Zone**

There was an overall increase in the cost of production of all the crops in the South-East region except in Enugu State. The cost of producing cassava and yam decreased from ₹674, 730 in 2019 to ₹452, 125 in 2020 for cassava and ₹722, 138 in 2019 to ₹685, 000 in 2020 for yam in Enugu State (Table 7.9). While Imo State reported higher changes in the production cost of all the tubers. The mean cost change increased across all reported tubers (yam (5%), cocoyam (12%) and sweet potato (18%)) in the zone except cassava recording a decrease of about -1%.

## **South-South Zone**

Significant reduction in the cost of production of cassava (-89%) was indicated by Bayelsa State in the South-South region as indicated in Table 7.10. While the highest change was reported by Akwa-Ibom State, from \$\frac{1}{2}206\$, 000 in 2019 to \$\frac{1}{2}250\$, 000 in 2020. Conversely the region showed a decreasing change (-12%) in total cost of production of cassava. Delta State recorded a marginal percentage change in terms of cassava production (0.1%) from 2019 to that of 2020. There was however positive increase in terms of cassava (15%), yam (15%), cocoyam (25%), sweet potato (15%) and cocoa (20%) production in Cross River State. The only ginger producing State (Ebonyi State) showed that the cost of production has increased from \$\frac{1}{2}788\$, 330 in 2019 to about \$\frac{1}{2}843\$, 330 in 2020.

#### **South-West Zone**

The South-Western States in Table 7.11 reported the average cost of production for cassava and yam to stand at №232, 079 (2019) and №238, 991 (2020) with an increase change of 2% for cassava, №354, 850 (2019) and №323, 505 (2020) recording percentage decrease change of -14% for yam. Separately, Ogun State recorded a decrease cost change in cassava (-2%),

yam (-5%) and cocoyam (-3%) production. However, Ondo State recorded no change, while Lagos recorded the highest cost change (17%) in terms of cassava production in the zone.

No data was available for cost of production of roots and tubers in all the States in the North Western-Zone.

## 7.3 Fruits and Vegetables

Fruits and vegetables contain important vitamins, minerals and plant chemicals. A fruit develops from the flower of the plant while the other part of the plant is referred to as vegetable.

## **South-East Zone**

In Table 7.18, there were only two States that reported the production of two crops in the South-East region. Majorly, Imo State reported increase in the cost of production of all the fruit and vegetable crops produced in the State. Noteworthy is the increase change in the cost of production of pineapple from ₹70, 000 in 2019 to ₹95, 000 in 2020 giving a percentage change of about 36%.

## **South-South Zone**

In the South-South, only Delta State reported changes in the cost of production of tomato standing at №142, 000 in 2019 and №142, 800 in 2020 with a marginal change of only 0.6% (Table 7.19). Further, the average change in cost of production in the zone for plantain was 7% with Edo State presenting the highest change (16%).

#### **South-West Zone**

Ekiti, Lagos, Ogun and Ondo were the only States that reported the cost of producing tomato, pepper and Okra in the South-Western zone (Table 7.20). There was a general increase in the cost of producing tomatoes and okra with Lagos State reporting the highest cost of producing tomato at ₹200,000 in 2020 against ₹150,000 in 2019. There was however a decrease in the cost of producing okra in Ogun State, reporting a decrease change of -2%.

## 8.0. FOOD COMMODITY PRICES

This section reports prices of major food commodities across the country. Comparison of prices were made between January and July 2019 and the corresponding periods in 2020. The tables for commodity prices were presented according to the 6 geopolitical zones of the country for ease of comparison. All values Stated are obtained from the analysis which compares the month of July 2020 to the same month last year.

# 8.1 Prices of Maize, Millet, Sorghum and Milled Rice

Increases in food prices especially for major cereals when compared with the previous year has continued unabated across the 36 States and the FCT. The high prices witnessed in the States are not different from the usual seasonal hike in prices experience during the lean period. Although, this may have been exacerbated during the month of July 2020 amidst COVID-19 mitigation measures which disrupted supply chains of major staple and cash crops across the country. Continuing demand for these four crops by households is reflected in the sudden and unanticipated sharp increase in prices with an upward trend.

Market prices of maize, millet, sorghum and milled rice were compared for January 2019/2020 and July 2019/2020. In line with seasonal trends, national average cereal prices have been increasing across the Zones (Table 8.1 – Table 8.6).

Markets in Nigeria continue to experience higher than usual maize prices. In July 2020, the national average maize price continues to rise above the 5-year average. For the period under review, strong significant increase of above 80% in the price of maize was witnessed as Adamawa and Jigawa States recorded the highest increase of 92% and 88% respectively in maize prices. Moreover, there was a significant increase in the price of maize across all zones. The highest percentage mean price variation for maize was recorded in the North Central Zone, while the lowest percentage mean price variation was recorded in the North-East Zone.

Prices of locally grown millet faced an upward surge when compared across States. Katsina and Yobe States recorded the highest increase (67% and 66%) respectively in millet prices. The highest percentage mean price variation for millet was recorded in the North East and North West Zones while the lowest mean increase was recorded in the South East. Generally, there was a 40% increase in price across all zones in the country.

The highest increase in Sorghum prices was reported in the South East and South South Zones. Ebonyi and Edo States recorded the highest price increase of 75% and 71% at a selling price of ₹220/Kg. The highest percentage mean price variation for sorghum price was recorded in the South South while the lowest mean increase was recorded in the North West. Generally, there was a 50% increase in price across all zones in the country.

The price of milled rice recorded an upward trend across the country. The highest increase in price was recorded in Jigawa, Plateau and the FCT with an increase of 83%. The highest percentage mean price variation for milled rice was recorded in the North Central Zone with (80%) while the lowest percentage mean price variation was recorded in the South-South with (46%).

# 8.2 Prices of Cowpea, Ginger, Groundnut and Benniseed

Comparison of market prices of Cowpea, Ginger and groundnuts were made for January 2019/2020 and July 2019/2020. Generally, the prices of cowpea ginger, groundnut and beniseed increase across all zones in the country (Table 8.7 – Table 8.12).

Nigeria is the largest producer and consumer of more than 7.4 million tons of cowpea produced worldwide, Nigeria accounts for 48% of production in Africa and 46% worldwide. There was slight increase in the price of cowpea when compared with July 2020 across the States. Adamawa State recorded the highest increase (14%) while Niger State recorded the lowest increase (1%) in cowpea prices. There was sudden increase in the price of cowpea as a result of disruption in the supply chain of cowpea into the market. The highest percentage mean price variation for cowpea was recorded in the North West Zone with 10% while the lowest mean of 6% was recorded in the North Central Zone.

Producing almost 523,000 tonnes annually, Nigeria has a 14% share in total global ginger production and is projected to keep growing at 6% per annum. Ginger is mainly grown in the Northern part of the country most especially in Kaduna State. The price of ginger faced the highest increase in Adamawa and Rivers States with a selling price of ₹420/Kg and ₹398.5/Kg respectively while Kaduna State had the lowest price at ₹306.3/Kg.

The highest increase in groundnut prices was reported in Bauchi (13%) and Adamawa (11%) States while Borno and Nasarawa States had the lowest increase of 5%. For the month of July 2020, the lowest percentage mean price variation for groundnut was in the North West Zone while the highest percentage mean price variation was in the South South Zone.

Nigeria is currently the seventh largest producer of beniseed worldwide; the highest increase in the price of beniseed was in Kano (18%) and Bauchi (17%) States. The highest percentage mean price variation for beniseed was recorded in the North East Zone.

Price of beniseed was not made available for all the States in the South West and South South Zones.

## 8.3 Prices of Beef, Chevon (Goat meat) and Mutton

Comparison of market prices of beef, goat meat and mutton were made for January 2019/2020 and July 2019/2020. Generally, there was price fluctuation for the commodities across all zones in the country. Comparing July 2019 and July 2020, the prices of food commodities like beef, chevon and mutton prices increased slightly or remained stable across all the States and FCT (Table 8.13 – Table 8.18).

The highest increase in price of beef was recorded in Kwara (50%) and Lagos State (30%) while Rivers State recorded a decrease of 7% in price. The highest percentage mean price variation for beef was recorded in the North Central Zone while the lowest was recorded in the South-East Zone.

Compared to July 2019, the prices of chevon (goat meat) showed an increase of 50 and 36 percent in Sokoto and Ondo States respectively while Bauchi State had a decrease of 8%. The highest percentage mean price variation for goat meat was recorded in the North East and South West Zone while the lowest was recorded in the South East Zone.

The price of mutton increased by 33 and 22 percent in Niger and Taraba States respectively compared to last year. Borno State recorded the lowest increase in price with 4% while in Katsina, Kebbi and Zamfara States, the price remains stable. The highest percentage mean price variation for mutton was recorded in the North Central Zone.

## 8.4 Prices of Fresh, Dry and Frozen Fish

Comparison of market prices of fresh, dry and frozen fish were made for January 2019/2020 and July 2019/2020. Generally, there was price increase for the commodities across all zones in the country (Table 8.19 – Table 8.24).

The highest increase in price of fresh fish was recorded in Kogi State (25%) while Cross River and Rivers States recorded the lowest increase in price by 4%. The highest percentage mean price variation for fresh fish was recorded in the North Central while the lowest mean increase was recorded in the South East and South South Zones.

The highest increase in price of dry fish was recorded in Bayelsa State (24%) while Gombe, Kano and Imo (20%) were among the highest increase. Meanwhile, Cross River State recorded the lowest increase in price by 2% while price of dry fish in Ogun State remains unchanged. The highest percentage mean price variation for dry fish was recorded in the North West Zone while the lowest mean increase was recorded in the North Central, South West and South-South Zones. The highest increase in price of frozen fish was recorded in Ondo (30%), Sokoto (23%) and Lagos (22%) while Osun State recorded the lowest increase in price with 4%. The highest

percentage mean price variation for frozen fish was recorded in the North West Zone while the lowest mean increase was recorded in the South East Zone.

# 8.5 Prices of Dressed Chicken, Egg and Paddy Rice

Comparison of market prices of dressed chicken, egg and paddy rice were made for January 2019/2020 and July 2019/2020. As compared to the previous year, price of chicken did show a significant increase across the 36 States and FCT (Table 8.25 – Table 8.30).

The highest increase in price of dressed chicken was recorded in Lagos State (27%) and Ondo State (25%) while Rivers State recorded the lowest increase in price with 3%. The percentage mean price variation for dressed chicken was recorded in the South West Zone while the lowest mean increase was recorded in the South South Zone.

The highest increase in egg prices was observed in Kwara (25%). Prices remained stable in Anambra and Ekiti States where no change was recorded, while Edo State recorded the lowest increase in price of 5%. The highest percentage mean price variation for egg was recorded in the North West while the lowest mean increase was recorded in the North East Zone.

The highest increase in price of paddy rice was recorded in Taraba (38%), Bauchi (35%) and Plateau (36%) States. The highest percentage mean price variation for paddy rice was recorded in the North Central and North East Zones while the lowest mean increase was recorded in the South West Zone.

### 9.0. FARMERS' ASSESSMENT OF CROPPING PERFORMANCE

This section reports on the demographic characteristics of the farmers and result of findings during the farmers' interview. The information described in this section include; sex of respondents; mean age of farmers, household size and composition, Area of land cultivated, farmers' production pattern, crop production, livestock production, fish farming, crop pest and diseases, input access and use etc.

## 9.1. Sample Design

A three-stage cluster random sampling was employed to select farmers for the survey. In the first stage cluster, two ADP Zones was randomly selected in each of the State. At the second stage, two LGAs was randomly selected in each of the selected ADP zones. Whilst at the third stage, one community was selected in each LGA in a State, making a total of four communities per State. In each selected community, five farmers were randomly selected making a total of twenty farmers per State. However, some States have less than twenty farmers; Thus, the survey covered a total of seven hundred and twenty-five (725) farmers.

A major limitation to the sampling and sample size was availability of funds, time constraints and human resources. The sample size used was representative of the States and agro ecological zones.

## 9.2. Data Collection, Processing and Analysis

Data was collected through face-to-face interviews with farmers, using an open data kit (ODK) application connected to NAERLS server.

Data cleaning and analysis was done using IBM SPSS Statistics Version 26 and Microsoft Excel 2019 for generation of charts. Data was checked and cleaned by eliminating some bias and outliers.

Descriptive statistics are expressed as means for continuous variables and percentages for categorical variables.

## 9.3. Demographic Profile of the Sample Population

#### i. Gender and Age of Farmers

A total number of farmers (N=725) were surveyed. When disaggregated by sex more males (76%) than females (24%) participated in the survey. The findings reported that male farmers dominate farming at a ratio 3:1 compared to their female counterparts (Figure 9.1).

Majority of the respondents (78%) were between 30 - 60 years of age. The ages of farmers were between 17 years and 75 years with a mean age of  $48.72\pm12.817$ . That is 49 years for male farmers and 47 years for female farmers as shown in Figure 9.2. The proportion of farmers

declined as the age category increased from 60 and above. Of the 725 farmers surveyed, at least 30% were between the ages of 20 - 40 years as against 46% in 2019, implying that there is drop in youth participation in agriculture in 2020.

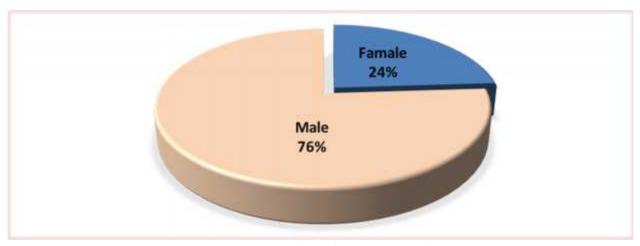

Figure 9.1: Proportion of Farmers by Gender

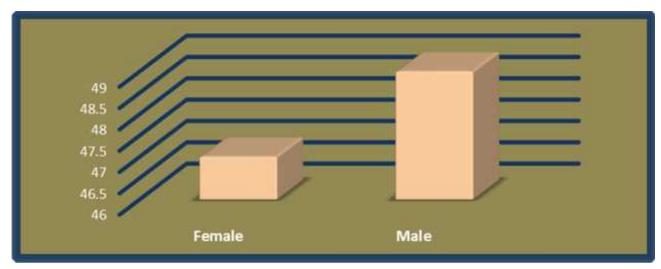

Figure 9.2: Mean Age of Farmers

# ii. Household Size and Composition

The average households' size ranged from 6 - 19. In the Northern Zones it was between 9 and 19 while it is between 6 and 11 in the Southern zones and parts of North Central Zone (Figure 9.3).

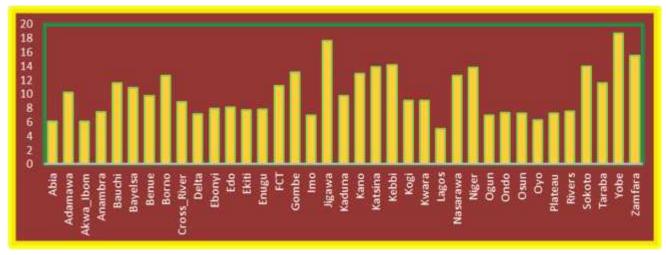

Figure 9.3: Mean Household Size

### iii. Area of Land Cultivated

Most farmers utilize 0.75 - 2.5 hectares for cultivation of crops in 2020. The median hectarage for maize farming was 3 hectares. During data collection, some farmers reported that they practice inter-cropping i.e. by planting different crops in the same piece of land. Most farmers attested that they increased their farm size in the 2020 cropping season. The closure of the nation's borders, rise in food prices and growing population are some of the factors that may have contributed to this rise in cultivated area.

## iv. Farmers' Production Pattern

In this survey, all the respondents were farmers at smallholder level and farming formed the major source of livelihood. Majority of the farmers had grown crops during the 2020 farming season. Most of the respondents (91%) were involved in producing crops, livestock (31%), poultry (18%) and fishing (5%) (Figure 9.4).

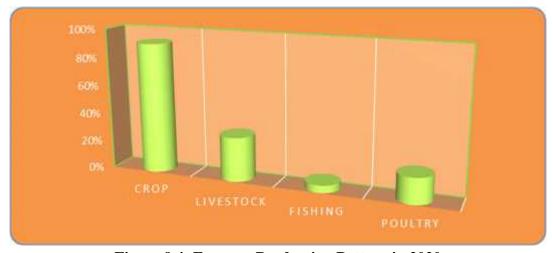

Figure 9.4: Farmers Production Pattern in 2020

## **Crop Production**

COVID-19 mitigation measures negatively impacted the production of crops in the current cropping season. As a result, the percentage of farmers who produced crops in 2020 decreased by 5% compared to 2019. On the average, farmers cultivated 2 or 3 staple crops across the States. Maize, rice, sorghum, yam, groundnuts, cassava and cowpea were the major crops grown by farmers. The proportion of farmers producing legumes (cowpea and groundnut) was generally not as high as those producing cereals. The production of legumes among farmers varied from State to State.

#### **Livestock Production**

Less than a third (23%) of farmers interviewed kept goat, followed by sheep (12%) and cattle (11%). The Table below (Figure 9.5) shows the type of livestock being owned by farmers. Most farmers' livestock are kept under low cost and low input forms of management.

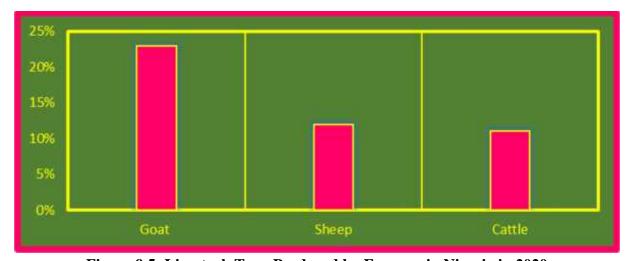

Figure 9.5: Livestock Type Produced by Farmers in Nigeria in 2020

#### Fish Farming

About 7% of the respondents from the Southern Zone indicated that they were involved in fish farming. This figure was mainly reported in Abia, Anambra, Bayelsa, Imo, and Lagos States. About 1% reported raising fish in plastic containers and the main fish species produced was catfish, while the main source of fingerlings was from specialized private fish farms.

## 9.4. Crop and Livestock Pest and Diseases

Farmers (62%) reported infestation of pest and diseases on crops while 14% reported infestation of livestock (Figure 9.6). However, crop pest and disease level were reported to be light to moderate impacts on maize in the current year with principal problem being armyworm in all the 36 States and FCT. Mole cricket and rodents were reported to attack rice farms in all the States with level of severity of the infestation been light. Other insect infestation reported include

nematode attack on yam with the level of severity being light. Bio-Pesticides were used by farmers to arrest the armyworm infestation on maize.

There were reported cases of new castle disease (NCD) of poultry and PestePetits Ruminants (PPR) of Goat/Sheep by farmers in 2020. Vaccination was reported as a measure undertaken to control the spread of livestock diseases.

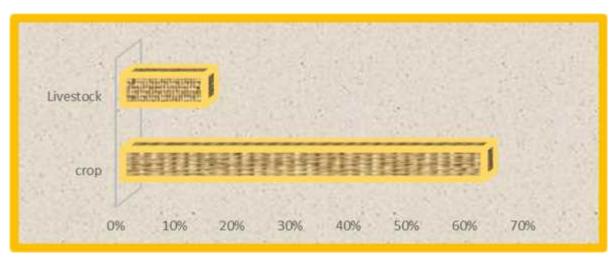

Figure 9.6: Reported Cases of Infestation on Crop and Livestock Produced by Farmers

## 9.5. Input Access and Use by Farmers

Farmers in the 36 States and FCT highlighted that access and purchase of farm inputs were from the open market in the current cropping season. Farm input such as inorganic fertilizer was scarcely used by majority of farmers on crops cultivated. Farmers attested that fertilizer was accessible but expensive and not affordable. Farmers did not receive fertilizer from the government in the year 2020. However, fewer farmers received seeds from the government. About 63% of the farmers interviewed purchase fertilizer at exorbitant prices, while 37% of the farmers did not purchase because they could not afford it. Also, no farm equipment such as tractors, Sprayers, Agro-processors were procured or made available to farmers by the Government.

The procurement and distribution of farm inputs for the year 2020 is yet to commence in all the States at the time of the visit. The problems associated with the procurement of production inputs and usage were attributed to COVID-19 mitigation measures to curb the spread of the virus. It was reported that farm inputs were only available at the open market but not affordable to most farmers.

Farmers are being denied high crop yields because they cannot afford sufficient fertilizer to replenish the nutrient-depleted soil. Therefore, holding back a significant increase in production output. For those farmers that use fertilizer, the fertilizer use per hectare is far lower than the recommended quantity, thereby resulting in poor crop yield.

## **Improved Seed**

Majority of farmers (69%) were aware of improved seeds but only 41% used them. 13% indicated that they bought seed in open container while 28% bought seal labelled improved seed. It can be seen that use of improved seed was low, probably because most farmers rely on saved seed from previous harvest.

#### **Fertilizer**

The use of inorganic fertilizer in Nigeria is relatively low and varies between States. The quantity of fertilizer both organic and inorganic applied on crops by farmers is insufficient thereby affecting productivity. Although 63% of farmers sampled used inorganic fertilizer, the application per hectare is low. Slightly more than half (57%) of the farmers reported that they used NPK, while some (37%) used Urea. Only a few farmers (1%) reported the use of Single Super Phosphate (SSP) fertilizer. This fertilizer application rate by farmers is not impressive. This may not be far from paucity of fund and high price of the commodity. About 40% of the farmers also reported that they use organic fertilizers (animal manure). The application of organic fertilizers was also minimal as only small amounts of organic fertilizer were used by individual farmers. The organic fertilizers used among farmers are mostly cow and small ruminant dung (31%) and poultry manure (17%).

#### **Pesticides: Herbicides and Insecticides**

As farmers have little tolerance for pest infestation, they rely heavily on the use of pesticides. Majority (87%) of farmers applied herbicides and insecticides to their farms. More of the farmers (55%) use herbicides while only 32% use insecticides. Among cereal farmers, herbicides are the predominant pesticides used to control weeds

Generally, insecticides application was low in all the six agro-ecological zones of the country. The application of fungicides was not reported.

### **Sources of Input**

Only a small fraction (5%) of farmers received Government input in 2020, a 6% drop over that of 2019. This is an indication that there was delay in the procurement and distribution of inputs in the country in the current season due to the lockdown imposed in most States to curb the spread of the corona virus. Only 2% of the farmers reported that they received input from Government in 2019 and 2020.

Only 19% of the respondents were able to use tractor for cultivation in 2020. Of this number, 2% hired Government tractors, a decline from 2019, while 14% hired tractor from private owners. Only 3% hired from Cooperative Associations. No farmer reported sourcing or receiving credit from Government in 2020. However, a small fraction (4%) had access to credit from farmers' cooperatives.

Government, at all levels, should facilitate availability of farm inputs at affordable rates to farmers in order to boost agricultural productivity, food security and enhanced livelihoods.

Farmers access their seed from formal and informal channels that provide them with a range of varieties of varying quality. The quantities of seeds purchased varied between 10kg and 50kg. The average cost of purchased seeds was about N2500. Seeds were mainly obtained from the local market (32%), government (22%), agro-dealers (21%) and seed companies (8%). Other sources were research institutes (6%), cooperatives (6%), and farmers' own stock (5%) (Figure 9.10).

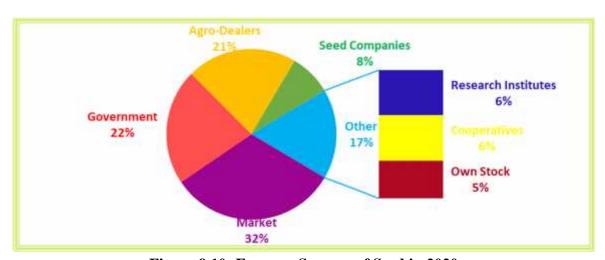

Figure 9.10: Farmers Sources of Seed in 2020

Farmers purchased fertilizers at an average cost of N10,000 per 50kg bag from the open market. NPK and urea fertilizers remain the common inorganic fertilizers used. The average cost of NPK and urea in the season ranged from N9,500 to N12,000 per bag.

Farm inputs sales were primarily purchased from the local markets within and outside communities. Inputs such as manure were obtained from cattle rearers, farmers' own stock and the market. One litre of herbicides and insecticides cost between N1,500 and N2,000 in such markets.

### 9.6. Production Output

The effect of the COVID-19 is expected to negatively impact crop production in the current season. When compared to the previous year, decrease in output are expected in 2020 in all the area of agricultural production. Some farmers said they anticipated a decrease in production output as a result of the crisis' impact on agriculture. However, about 47% of farmers were optimistic and expect higher output than 2019 which is a sharp drop from the proportion of farmers in 2019 (70%). 32% of the farmers expect their production to be below that of 2019;

while about 11% expect their output to be the same. About 10% were not sure of their expected output in the current season (Figure 9.11).

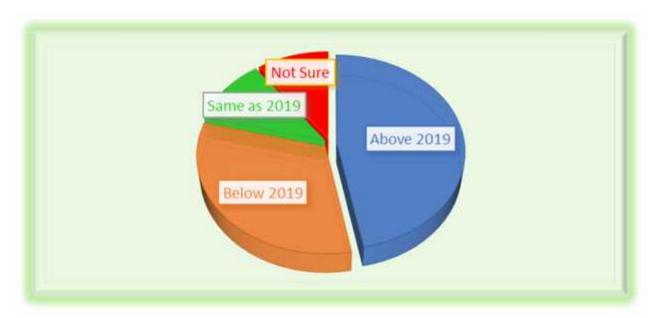

Figure 9.11: Farmers Expected Output for 2020 Season

## 9.7. Sources and Types of Extension Services

The proportion of farmers who receive extension advice is still low in Nigeria. In the survey across 36 States and FCT, 52% of sampled farmers accessed extension services in 2020.

There was an average of 487 farmers receiving extension advisory services representing 67% of the total number of respondents. The following are the proportions receiving extension advice from various sources: Extension Agents (52%), Radio (23%) and Friends/Co-farmers (19%) (Figure 9.12).

A major constraint is disproportionate ratio of extension agents to farmers. The ratio of national extension agent to farmers is 1:3500, compared with the recommended 1:800 (FAO).

Most of the farmers that had access to Extension Agents were farmers that had access to the services of the Agricultural Development Programme (ADPs) in their respective Zones. This result does not reflect the true picture of farmers' access to agricultural information in Nigeria since it excludes the thousands not being powered by the ADPs. Hence, Radio and Co-farmers still constitute the most common source of agricultural information for Nigerian farmers.

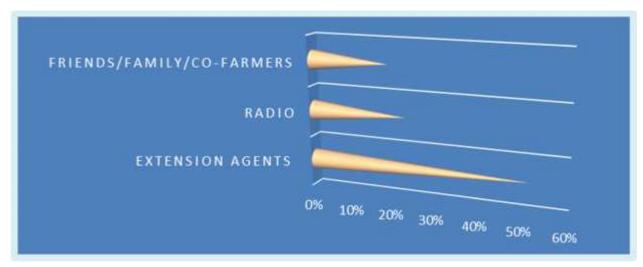

Figure 9.12: Farmers Sources of Agricultural Information in 2020

## 9.8. Constraints to Electronic Media Use by Farmers

Electricity supply and timing are the major constraints affecting electronic media use by farmers. Some farmers indicated that their communities do not have electricity and those that have reported erratic supply. Most of these farmers rely on batteries to power their radios (Figure 9.13).

Figure 9.13: Constraints Affecting Farmers Use of Electronic Media in 2020

### 9.9. Food Consumption Pattern and Household Dietary Diversity

Food consumption was assessed over a 24-hour reference period to estimate food and nutrient intake adequacy. Further to estimate usual consumption intake, an extended reference period of seven days recall was used. Also, dietary diversity, a well-recognized and an important dimension of diet quality was adopted using Household Dietary Diversity. Household dietary diversity (HDD), defined as the number of unique foods consumed by household members over a given period, has been validated to be a useful approach for measuring household food access.

The analysis showed that although all starchy food and vegetables constituted the main foods consumed by the farmers, a number of meals with varying ingredients were consumed based on the two food groups which are mostly complemented by oil and fat.

The food group most frequently consumed by households was starchy staples, especially cereals. Findings from the survey indicated that 93% and 96% of the households consumed vegetables and cereals respectively in the last 24 hours and were consumed at least 6 to 7 days a week in all Northern States except Benue, Gombe, Niger and Plateau States. Households consumed cereals or starchy roots and tubers every day of the week, except in the Southern Zones, where cereals were consumed at an average of 4 days a week and tubers, 3 days a week. The consumption of legumes, including cowpea, soybean and groundnut was low. On the average, households consumed legumes 2 to 3 times a week across all the States.

In general, the consumption of egg and dairy products (38% and 48%) were very low. On the average, households consumed egg once a week across all the States. The number of households that consumed meat or fish during the 24 hours preceding the survey were about 64% and 69%. There were few households that could afford fish up to four times a week. However, the number of households were less as frequency increased. As for meat, the highest frequency was two times a week. It is apparent that fish consumption dominated meat.

The result of the survey showed that all starch staple and vegetables were consumed by majority households. Eggs and all dairy were consumed poorly; this pattern was similar in all States. About a third (32%) of the households had a Household Dietary Diversity Score (HDDS) greater than 6 food groups per day. 23% had 5 food groups, 28% had 4 food groups, while 17% had 3 food groups (Figure 9.14).

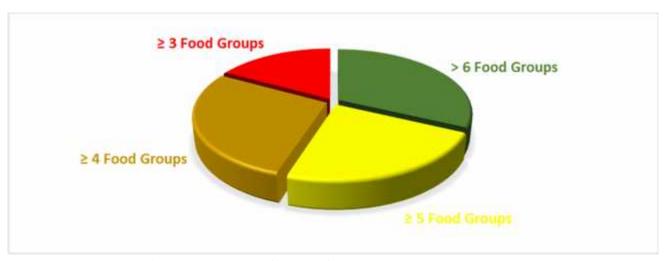

Figure 9.14: Food Groups Consumed by Households

Focus needs to be given not only to increasing the production of and access to food but also its consumption, ensuring that the poor have access to adequate quantities of safe, good quality food for a nutritionally adequate diet. This includes not only energy, protein and fats but also micronutrients so necessary for normal growth and development.

## 10.0. LAND AREA & PRODUCTION ESTIMATES FOR MAJOR CROPS

#### 10.1. Rice

Rice is a major staple in Nigeria and it is grown in all agro-ecological zones of the country. The estimated crop area for rice in 2020 was 4,195,070Ha, which represented an increase of about 1.66% over the 4,126,670Ha cultivated in 2019. The surge in the price of rice triggered increase in the land area cultivated by farmers in 2020. However, due to the flood that affected some States like Jigawa, Kebbi, Kano, Sokoto and Kaduna, the national rice output is estimated to decrease by 3%, that is, from 8,435,610 tons in 2019 to about 8,171,750 tons in 2020. About 76% of the States recorded decrease in the output of rice. The estimated national average yield of rice was 2.04 tons per hectare in 2019 and 1.95 tons per hectare in 2020. The decrease in rice yield is attributed to low hybrid seed uptake amongst the smallholder farmers.

Table 10.1: Land Area and Production Output for Rice

### **10.2.** Maize

The total estimated land area cultivated for maize in 2020 is about 6,048,610Ha, indicating 0.25% increase over the 6,033,410Ha cultivated in 2019. Similarly, maize production declined from 12.6 million tons in 2019 to 12.4 million tons in 2020 representing a 1.55% reduction arising from rainfall deficit (prolong dry-spell) in the South West and some parts of the South East Zones, flooding in some parts of the North East and North West Zones and inadequate fertilizer application on maize farms.

The national average yield of maize was 2.09 tons per hectare in 2019 and 2.05 tons per hectare in 2020. Decrease in maize yield is also attributed to low level cultivation of improved seeds and drought tolerant maize varieties.

## 10.3. Sorghum

Sorghum is mostly grown in the Northern States of Nigeria with total estimated land area of 5,799,590Ha in 2020, indicating a decline in cultivated land area by -0.37% relative to 5,821,240Ha recorded in 2019. The production of sorghum in 2020 recorded a drop in the North East and North West Zones, when compared to 2019. The decrease is associated with the flood experienced in most Northern States especially in Bauchi, Zamfara, Jigawa and Kebbi States. Some States in the North Central Zone also recorded a decrease in production in which Niger State recorded a drop of 4.63% when compared to 2019. The output of sorghum of 6,590,400MT represented a decrease of about 1.17% compared with 2019 production figure. The national average yield of sorghum was 1.15 tons per hectare in 2019 and 1.14 tons per hectare in 2020.

## **10.4.** Millet

Millet is cultivated in the Northern States of Nigeria. It has a total crop area of 1,762,290Ha in 2020, compared with 1747.80Ha in 2019. The North West zone is the major producer of this crop, followed by North Central and the North East zones. The total estimated millet output for 2020 was 1,905,430MT as compared to 1,925,080MT estimated for 2019. In 2020, the production output decrease by 1.02%. The national average yield of millet decreased from 1.10 tons per hectare in 2019 to 1.08 tons per hectare in 2020.

# **10.5.** Cowpea

The total land area cultivated for cowpea in 2020 was 4,973,520Ha which is an increase of 0.86% over 4,931,320Ha cultivated in 2019. The North Central Zone is the highest producer of cowpea, contributing over 29% to cowpea production in the country. The zone is closely followed by the North East, which contributed 25% of the total output. The major producing States are Niger, Taraba, Borno, Bauchi, Zamfara, Kano, Jigawa, and Gombe. National output figure for cowpea in 2020 showed an increase of 1.68% when compared to that of 2019. The national average yield of cowpea was 0.82 tons per hectare in 2019 and 0.83 tons per hectare in 2020.

#### 10.6. Groundnut

Groundnut is produced mainly in the Northern States of Nigeria; however, some few southern States also produce small amounts. The estimated land area cultivated for groundnut in 2020 was 3,596,420Ha which is an increase of 0.5% over 3,578,670Ha under groundnut cultivation in 2019. The major groundnut producing States in the country are Nasarawa, Niger, Kano, Jigawa, Katsina, Benue, Taraba, Gombe, Adamawa, and Zamfara. Although some of these States recorded marginal increase in the production of groundnut, the North Central Zone recorded a decline in production. The percentage increase on a national scale was of 0.52%. The national average yield of groundnut was 1.24 tons per hectare for both 2019 and 2020.

## 10.7. Soybean

The estimated land area cultivated for soybean in 2020 was 1,207,740Ha, representing an increase of 5.2% over the 2019 figure of 1,148,050Ha. The North Central and North West zones are the major soybean producing areas, accounting for 82% of the production. The major producing States are Benue, Kaduna, Taraba and Niger. In 2020, soybean recorded an increase of 5.48% over the 2019 output.

Increase in the production of soybean occurred largely because farmers of cereals such as maize and sorghum shifted to legumes that require less fertilizer application. The national average yield of soybean was 0.91 tons per hectare in 2019 and 0.92 tons per hectare in 2020.

## 10.8. Beniseed

Beniseed is an important oil crop cultivated in many parts of Nigeria. It has an estimated land area of 820,630Ha in 2020, which is an increase of 4.86% over the 782,590Ha recorded in 2019. It is more readily cultivated in the North Central, North West and North East Zones. A marginal increase of 6.06% was recorded for output of beniseed, from 523,430MT in 2019 to 555,160MT in 2020. The national average yield of beniseed was 0.67 tons per hectare in 2019 and 0.68 tons per hectare in 2020.

### 10.9. Yam

Yam is an important tuber crop in Nigeria. The crop is found in all the agro ecological zones of the country. The total land area cultivated for yam in 2020 was 7,128,100Ha which is an increase of 5.16% over the 2019 figure of 6,778.080Ha. The major producing zone is the North Central, followed by the South East Zone and North West Zone. The output of yam in the country had recorded a marginal increase of 6.48% when compared with 2019 output. The national average yield of yam increased from 7.81 tons per hectare in 2019 to 7.90 tons per hectare in 2020.

### 10.10. Cassava

Cassava is also cultivated in all agro-ecological zones of Nigeria. Estimated land area in 2020 was 9,609,080Ha reflecting 1.71% decrease of 9,776,650Ha in 2019. The major producers of cassava are States in the North Central Zone, followed by the South-South and South West zones. Cassava is one of the major root crops in the country but it did not record a significant change in output in 2020. A decrease of about 2.47% in output is expected for cassava in 2020. The national average yield of cassava decreased from 5.83 tons per hectare in 2019 to 5.78 tons per hectare in 2020.

**Table 10.10: Land Area and Production Output for Cassava**

## **10.11.** Cocoyam

Cocoyam is generally cultivated across the country. The area cultivated for cocoyam in 2020 was 1,332,030Ha which represents 8.90% increase over the 2019 estimate of 1,223,180Ha. Due to the prolonged dry spell in the Southern States of Nigeria, cocoyam recorded a drop of 0.42% in output.

The national average yield of cocoyam decreased from 6.46 tons per hectare in 2019 to 5.91 tons per hectare in 2020.

#### 10.12. Cotton

Cotton is the most important fibre crop in Nigeria, with a total crop area of 510,370Ha in 2020. This estimated land area thus decreased by 0.39% over the 512,380Ha cultivated in 2019. Production of cotton, especially the long staple varieties in the South West, is on the increase. The major producers of cotton in Nigeria are Katsina, Zamfara, Kano, and Kaduna, Gombe, Adamawa, Borno and Bauchi States. The output of cotton recorded a marginal increase of 2.68%, most of it coming from Katsina, Zamfara and Bauchi States. The national average yield of cotton was 0.45 tons per hectare in 2019 and 0.46 tons per hectare in 2020.

**Table 10.12: Land Area and Production Output for Cotton**

#### **10.13. Ginger**

Ginger is an important spice crop cultivated in Kaduna, Bauchi, Benue and Nasarawa States. The land area for ginger is estimated at 102,060Ha and 8.89% over the 2019 figure. Similarly, output of ginger increased by 0.35% in 2020. The decrease in production output of ginger in Benue and Kaduna States is attributed to the security challenge that limits farmers' access to far farmlands. The national average yield of ginger decrease from 7.24 tons per hectare in 2019 to 6.68 tons per hectare in 2020.

Table 10.13: Land Area and Production Output for Ginger

### **10.14. Tomato**

Tomato is cultivated in all the agro-ecological zones of the country. Tomato production area is estimated at 1,588,180Ha in 2020, which represents about 7.42% increase over 2019 figure. The output of tomato increased by 6.16%. The national average yield of tomato was 2.10 tons per hectare in 2019 and 2.07 tons per hectare in 2020.

### 10.15. Onion

Onion is cultivated mainly in the Northern States of Nigeria with very small amounts in the South West Zone. The total crop area for onion was 589,620Ha in 2020 which is an increase of 3.77% over the 568,230Ha recorded for 2019. The production of onion increased marginally in 2020 by 3.62%. The national average yield of onion was 2.58 tons per hectare in 2019 and 2.57 tons per hectare in 2020.

# 10.16. Okro

Okra is grown in all agro-ecological zones of Nigeria with a total estimated crop land area of 1,473,150Ha which is an increase of 2.96% over 2019 figure. The production output of okra also increased by 2.33% in 2020. The national average yield of Okro was 1.20 tons per hectare in 2019 and 1.19 tons per hectare in 2020.

### 10.17 Plantain and Banana

Plantain and banana are grown mostly in the Southern zones of Nigeria with a total estimated crop land area of 476,070Ha which is an increase of 5.6% over the 2019 figure. The production output figure of plantain and banana increased by 1.04% in 2020. The national average yield of plantain and banana decreased from 12.26 tons per hectare in 2019 and 11.73 tons per hectare in 2020.

## 11.0. LIVESTOCK PRODUCTION SITUATION

### 11.1. Livestock Population

The population of livestock of different species for 2019 and 2020 were presented in Table 11.1a and b. There was a total of 177,545 heads of cattle which was recorded as increase for the nation in 2020 indicating an increase of 0.87%. The population of chickens increased by 15,607,265 amounting to 7.5% increase in the stocks in 2020. Sheep population also increased by 1,168,906 (2.5% increase from 2019). Goat population in Nigeria increased by 1,324,413 (1.6% of the population in 2019). Similarly, increase was recorded for all other species of livestock presented in this report.

Figures 11.1 to 11.7 showed the States of Nigeria with the ten largest populations of different species of livestock. Ten States in Nigeria with the most population of cattle accounting for 80% of the total population of the species in 2020 was shown in Figure 11.1. Zamfara State had the largest population of cattle (3,462,348) and sheep (7,496,874) (Figure 11.2). The largest population of goats (6,463,210) was found in Katsina State as shown in Figure 11.3. The ten States with the largest populations of pigs accounted for 84.6% of the species in 2020 (Figure 11.4). Plateau State had the largest population of pigs with 1,866,367.

Livestock population of smallholder and commercial farms were shown in Tables 11.3 and 11.4, respectively. Varying numbers of stocks are being kept by farmers either in backyard or commercial production.

#### 11.2 Livestock Pests and Diseases

Livestock pests and diseases is indicated in Tables 11.4a and 11.4b as documented by 27 States in 2020. Contagious Bovine Pleuroneumonia (CBPP) was recorded in Bauchi and Gombe (North East), Zamfara and Jigawa (North West), Benue, Kogi, Taraba, Kwara and Nasarawa (North Central), Osun (South West), Anambra and Cross River (South East), and Edo and Delta (South South). This indicated that CBPP affected cattle in one or more States across the six (6) agroecological zones. Cattle were also affected by helminthiasis (Figure 11.8).

Peste des petits ruminants (PPR) is an acute viral disease that affected sheep and goats in some States in 2020. The States affected were Bauchi, Gombe, Jigawa, Benue, Kwara, Plateau, Taraba, Ekiti, Lagos, Osun, Ondo, Anambra, Ebonyi, Imo, Enugu, Akwa Ibom, Cross River and Edo States. Helminthiasis, which is a severe disease that affect sheep, goats and swine was recorded for nine (9) States which include Yobe, Gombe, Benue, Kogi, Kwara, Ekiti, Osun, Cross River and Edo States (Figure 11.9). Other diseases that affected sheep and goat in 2020 were fasciola, mange and foot rot.

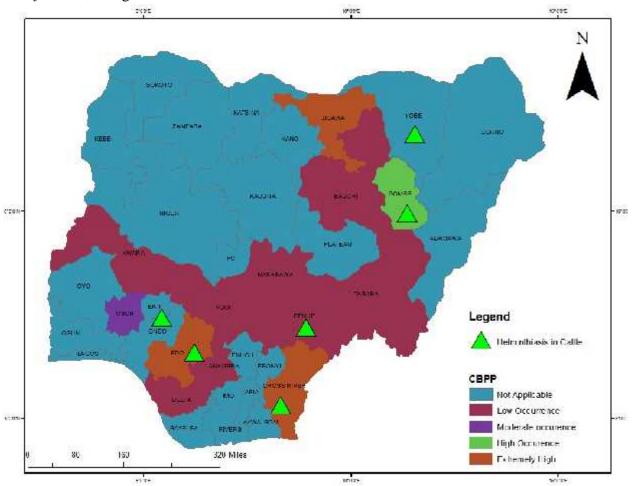

Figure 11.8: States with incidence of CBPP and Helminthiasis

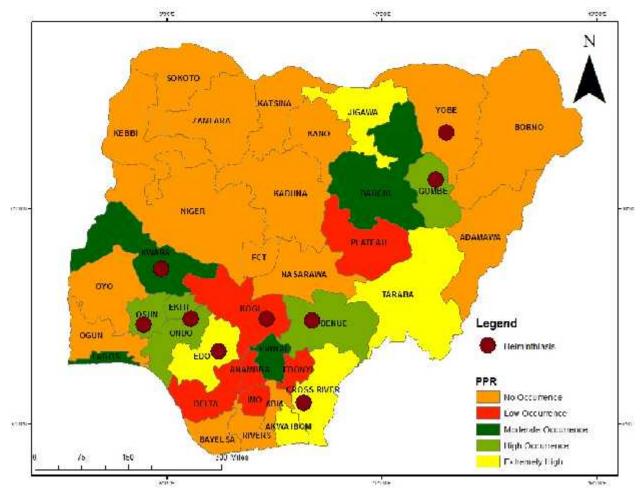

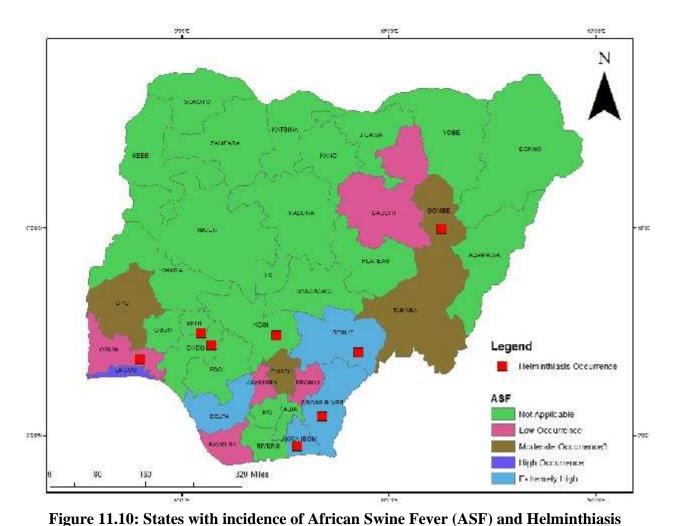

Figure 11.9: States with Incidence of PPR and Helminthiasis

African Swine Fever (ASF) is a viral disease to which only pigs are susceptible. The reported States with this viral disease include Bauchi, Gombe, Benue, Plateau, Lagos, Ogun, Oyo, Anambra, Ebonyi, Enugu, Akwa Ibom, Bayelsa, Cross River, Edo and Delta (Figure 11.10).

Diseases recorded in 2020 to had affected poultry include Gumboro (Infectious Bursal Disease - IBD), New castle disease (NCD), fowl pox and coccidiosis. Gumboro is a highly contagious disease that affect poultry (Figure 11.11) in Bauchi and Gombe (North East), Jigawa (North West), Krange FCT and Torche (North Control), Open Cords and Open (South West), Angelone

West), Kwara, FCT and Taraba (North Central), Osun, Ondo and Oyo (South West), Anambra, Ebonyi and Enugu (South East), and Cross River and Delta (South South).

New castle disease is a viral disease that also affected poultry in 2020 (Figure 11.11). The disease affected poultry in Bauchi, Gombe, Jigawa, Benue, Kwara, Plateau, Ekiti, Osun, Oyo, Ondo, Anambra, Ebonyi, Imo, Cross River and Edo. Vaccination and other preventive measures were taken by some States to control the occurrences of these diseases.

# 11.3 Livestock-Related Facilities in Nigeria

Livestock-related facilities were shown in Tables 11.5 to 11.11. Nigeria livestock industry is blessed with a lot of facilities. However, more facilities are still needed to meet up the demands for animal sources of protein by ever increasing population of humans in the country.

## 11.5: Livestock Production Inputs

Table 11.3 shows the livestock production inputs procured and distributed in 2019 and 2020 by some States. The States include Gombe (North East), FCT and Taraba (North Central), Katsina (North West), Osun and Ondo (South West), Anambra (South East), Delta and Cross River (South South). Poultry feed, supplements and items/equipment were prominent among the inputs procured and distributed in 2019 and 2020. Contagious bovine pleuropneumonia (CBPP) and *Peste des petits ruminants* (PPR) vaccines were purchased and distributed by Gombe State in 2020. Across all the 9 States, the major animals procured were day-old-chicks and turkey poults. Ondo is the only State that procured turkey poults and weaner goats but distributed none. Osun State procured the highest number of day-old-chicks in both 2019 (200,000) and 2020 (44,000) respectively. Construction of snail hutches (42) was made by Delta State and distributed. Disinfectants (Quaternary ammonium) and insecticide (Cypermethrin) were procured and distributed by Anambra State. Most procured livestock inputs were distributed in 2020.

Table 11.14: Livestock Production Inputs in 2019 and 2020

#### 11.6 Livestock Production-Related Risks

Table 11.14a shows the information on the farmers-pastoralist conflict and the extent of damage caused. The conflict for 2020 was recorded from 20 States across 5 agro-ecological zones excluding North West. No livestock loss was recorded in Bauchi, Gombe (North East), FCT, Nasarawa, Plateau, Kogi (North Central), Ekiti, Ondo (South West), Ebonyi (South East) and Delta (South South). Human lives lost as a result of farmers-pastoralist conflict were numerous in Benue, 11 in Bauchi, 7 in Imo, 5 in Akwa Ibom and 1 in Gombe. Oyo recorded the highest livestock lost (450) in 33 LGAs with regular occurrence of the farmers-pastoralist conflict. Ondo recorded a weekly occurrence of the conflict State wide with no property, livestock and human life lost. There was also no record on lives, properties and livestock recorded in Kogi, Ebonyi and Delta States.

Cattle rustling incidence were rampant in the 10 States recorded during agricultural season of 2020 (Table 11.4b). Majority of the rustling cases recorded were from the North Central (Nasarawa, Taraba and Plateau) and South South (Delta), though no live, livestock or property was lost. Edo occasionally recorded cattle rustling attack with the highest number of livestock lost (200) followed by Bauchi (16). Akwa Ibom is the only State that recorded a live lost.

Kidnapping has always been a threat to farmers and their properties. Table 11.4c shows record of kidnapping cases in 2020. Plateau, Edo and Delta recorded frequent attack but no livestock or human life was lost. FCT and Niger (North central) recorded the highest (35) human lives lost and the highest number (70) of livestock lost, respectively. As a life threatening case, kidnapping attack has been recorded in 15 States with little or no life lost.

#### 12.0 FISHERIES PRODUCTION SITUATION

Aquaculture production output in 2020 as compared to 2019 shown in (Table 12.1a) revealed that only 23 States including FCT provided data. Marginal increases were recorde in production in 2020 in some States in the North with a decreasing trend in the Southern States. This decrease in production may not be unconnected with increased cost of input which may have arisen as a result of COVID-19 pandemic lockdown and restrictions on movements for economic activities. There is paucity of data for artisanal fisheries production in 2020 in all the agro-ecological zones (Table 12.1b); although Lagos, Ekiti, Delta and Imo State had data for 2020 which showed a decrease in production compared to 2019.

Data on inputs situation revealed that only 7 States and the FCT procured and distributed various fisheries inputs to farmers, some of the inputs procured and distributed are catfish fingerlings, fish feeds, fishing nets, outboard engine fishing boats, collapsible tarpaulin ponds, cold store and smoking kilns. These inputs were provided to farmers at subsidized rates.

The quantity of fresh and smoked fish marketed (Table 12.3) in 2020 shows that catfish species were the most traded fish species in all the States reported. This invariably showed that catfish is the most abundant and populous fish species cultured in Nigeria. This is followed by Tilapia species. Other fish species traded are Heterobranchus species, Heterotis species, Labeo species, Lates niloticus etc. Captured fisheries provided most of the fish species traded both fresh and smoked in all the States. This is an indication of pressure on wild fish stock due to reduction in aquaculture production output. This may affect the stock in the artisanal fisheries in the long run hence aquaculture production needs to be encouraged by provision of the necessary production inputs.

#### 13.0. IMPACT OF COVID-19 ON AGRICULTURAL PRODUCTION IN NIGERIA

#### 13.1. Preambles

The Corona virus pandemic also known as COVID-19 is an ongoing global health challenge affecting many lives and families of which Nigeria is not an exception. It is caused by a severe acute respiratory syndrome coronavirus (SARS-CoV2). The out-break was first identified in Wuhan, China in December 2019 and it became an outbreak of international public health concern on 30<sup>th</sup> January 2020 and a pandemic on 11<sup>th</sup> march 2020. This pandemic has affected over 29 million lives all over the world and about 56,478 in Nigeria. Different measures have been implemented to reduce its spread by various nations of the world including Nigeria. The Nigerian government implemented the lockdown in March 2020 to combat the pandemic. This resulted in restricted movement of individuals (agricultural producers and marketers inclusive) as well as commodities with peoples' livelihoods negatively affected.

Agricultural producers and marketers constitute a significant component of the Nigerian economy. Their products are the major sources of food to the Nigerian populace and are essential in building body cells and the immune system of the human body against this virus. In spite of massive engagement in agriculture by its population, Nigeria is facing a major crisis in food security arising from inadequate food production, poor yields, poor storage facilities, post-harvest waste, etc. The case is not different for livestock and fisheries production and is further compounded by the pandemic, whereby there has been a decline in productivity and marketing due to restricted movement of agricultural commodities and individuals. The Agricultural performance survey was carried out after the lock down was eased and intra and interState movement was permitted.

The Agricultural Performance Survey 2020 revealed that 99.7% of the farmers were aware of the Covid-19 pandemic and 76% of the farmers received such knowledge from community health workers as well as the broadcast media (TV and Radio) through the National Centre for Disease Control (NCDC). Also, from the survey results 4.0% of the sampled farmers reported positive cases of the virus in their community and 79.3% of the farmers were aware of the preventive measures of the disease.

### 13.2. Effect of CoronaVirus Pandemic on Crop Production and Marketing

The pandemic precipitated disruption of food production systems, and as such posing a great threat to farmers' livelihoods as well as national food and nutritional security. From the survey, 73.1% of the farmers predicted a food shortage, while 68.3% of the crop farmers reported a decline in crop production due to the pandemic. This predicted decline in crop production would have occurred due to inability to carry out farming activity as well as lack of access to crop production inputs (seeds, fertilizer and seedlings) during the period of the lock down. This result

corroborates the estimates of the Economic Community of West African States (ECOWAS) that the COVID-19 pandemic risks food insecurity and nutrition of 50 million people between June and August 2020; and that the pandemic aggravated the prevailing threats of climate change and recurrent drought as well as Fall Armyworm (FAW) and locust infestations in West Africa.

From the survey, farmers reported a shortage in casual labour (67.4%) which may have resulted from restriction in movement within the States. Many farmers (93.5%) across the country reported a sharp increase in market prices of staple food in the months of July and August. The market price of cereals (maize, sorghum and millet) rose from 95.0-150% in Bauchi, Borno, Gombe, Jigawa, Kaduna and Yobe States, whereas for legumes (cowpea), the market price increased by 50-80% in Adamawa, Bauchi, Gombe, Jigawa, Kaduna, Kano, Katsina and Yobe States. This increment in prices of staple food occurred during the lean season and the pandemic also aggravated it.

## 13.3. Effect of Corona Virus Pandemic on Livestock Production and Marketing

The pandemic adversely affected livestock production as reported in the annual performance survey of 2020. From the survey, 55.7% of the sampled farmers attested to a decline in livestock production in the country. The restriction to movement (intra and inter-State restriction) resulted in increased market prices of livestock inputs such as feed and medication. Similarly, pastoralists experienced shortages in feed due to restricted migration in search of pasture, while poultry producers/marketers experienced shortages in supply of day-old chicks, feed and medication, also there were reported cases of egg-glut as producers could not connect with consumers during the lock down. Accessibility to livestock extensionist and health workers was also hampered due to restricted movements. All these negatively affected livestock/poultry farmer's income and livelihoods during the period of the lock down.

## 13.4. Effect of Corona Virus Pandemic on Fisheries Production and Marketing

The COVID-19 pandemic affected the fish and seafood value chain globally. Fish farmers in Nigeria had restricted access to fish inputs (fingerlings, feed, medication and fishing implements). Also, debts were incurred in feeding stocks as fish farmers were unable to harvest while producers had problems relating to importation of brood stock. Also, there were disruptions in supply chain as well as decline in production and consumer demand, thus hiking the price of fish and aquatic food.

It was observed that there was a decrease in demand by large-scale buyers particularly restaurants, hospitality and catering sectors due to the lock-down measure implemented by the federal and State governments and this lowered the demand for certain fish products in Nigeria. A decline in domestic demand has been compounded by a collapse in export markets. The social distance and confinement measures also led to the closure of many fish markets and trade has

been further affected by border closure. These challenges have created further impacts for sale of fresh fish products where demand still exists domestically and internationally. In many places, loss of demand and difficulties in reaching consumers has led to volatile prices. In addition, the health and safety measures implemented reduced labour mobility all along the supply chain. All the proportions reported are presented in Figure 13.1.

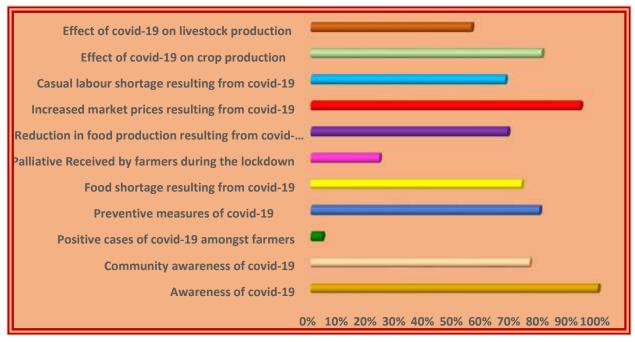

Figure 13.1: Responses of farmers about the COVID-19 Pandemic

## 13.5. Palliatives received by farmers from federal government and other agencies

The federal government has made some effort to reduce the effect of COVID-19 pandemic on the agricultural value chain. One of which is the distribution of about 70,000 metric tonnes of grains from the strategic food reserve across the country. However, from the survey, only 23.7% of the farmers benefited from the palliatives. The Central bank of Nigeria (CBN) also improved its funding to the agricultural sector and reduced interest rates on existing intervention funding from 9 % to 5% during the lock down.

Also, the Federal Government in collaboration with the Consultative Group on International Agricultural Research (CGIAR) developed strategies to facilitate free movement of food and agricultural inputs to some selected States which included improved seeds of sorghum, pearl millet, cowpea and rice as part of an initiative to cushion the pandemic's impact on food systems. These States were selected based on the importance of sorghum and millet as food crops and access of partners to needy smallholder farmers.

To mitigate the impact of COVID-19 pandemic and contribute to building sustainable food system and security, the International Crops Research Institute for the Semi-Arid Tropics (ICRISAT) developed a three-phase response plan namely: the recovery and coping phase, adaptive phase and transformative phase in West and Central Africa. ICRISAT in partnership with the government of Nigeria distributed high quality seeds to 10,000 farmers as a support initiative to shield them from the impact of COVID-19 and lockdown measures.

## 14.0 FLOOD DAMAGE ASSESSMENT

#### 14.1. Flash Flood Occurences

Flooding occurs in Nigeria annually with devastating impacts on the poor and vulnerable populations who live along the river basins. The Nigeria Hydrological Services Agency (NIHSA) predicted a total of 28 States and 102 Local Government Areas of the States will be at risk of heavy flooding in the year 2020. According to the Agency the flood projections will vary from moderate to severe flooding in most parts of the country. This warning was meant to plan for flood preparedness, mitigation and responses.

The report from the 2020 survey confirmed the occurrences of flood in some States as predicted by NIHSA. According to the reports as shown in Table 14.1, twenty-four States in the six agroecological zones experienced flood. Table 14.2, 14.3, 14.4, 14.5, 14.6 and 14.7 show the impact of flood according to agroecological zones. The tables show the States affected, LGAs affected, crops/infrastructures affected, the month of flood and the severity of damages. Different species of crops were affected. Houses, crops, bridges and human life were also lost. Flood situations were reported in almost all the States in Northern Nigeria with the exception of Benue State. However, flooding was reported in six States in the Southern part of the country (Table 14.1).

Table 14.1: States that were affected by flood according to agro-ecological zones

Zone	Affected State

Table 14. 8 shows the number of houses destroyed by flood according to States. A total of 62,083 houses were destroyed by flood in 15 States of the federation. The State with the highest number of houses destroyed is Jigawa State (50.000) followed by Kano State (5,200). The least

number of houses destroyed by flood was recorded in Nasarawa State with 6 houses destroyed (Plate 14.1).

Table 14.8: Houses destroyed by flood

State	Number of houses
Jigawa	50000
Kano	5200
Bauchi	3042
Katsina	1800
Edo	1000
Borno	240
Plateau	200
Zamfara	110
Akwa Ibom	100
Sokoto	100
Kwara	100
Gombe	100
Niger	50
Lagos	35
Nasarawa	6

Plate 14.1: Houses submerged by flood in Nasarawa State

## 14.2. Human Lives Lost

Figure 14.1 shows the total number of people that lost their life due to the flood situations. A total of 86 people was reported dead due to the flood situation that occurred in nine States of Nigeria in 2020. The States are Kano, Sokoto, Jigawa, Kebbi, Gombe, Niger, Bauchi, Nasarawa and Kwara State. The highest number of 20 human life were lost was in Jigawa State.

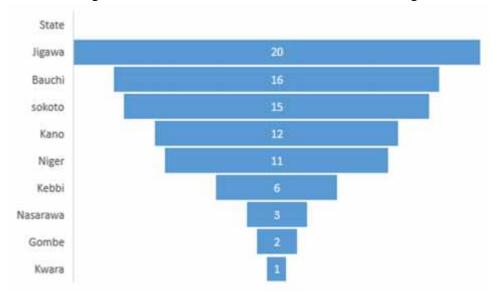

Figure 14.1: Number of life lost due to flood situations according to States

## 14.3. Number of Displaced People

Figure 14.2 shows the number of people displaced by flood according to States. A total of 37,754 people were reportedly displaced by flood in Six States (Kano, Borno, Zamfara, Katsina, Anambra and Nasarawa) The highest number of people displaced was recorded in Nasarawa State with 20,000 people displaced. Zamfara State also had 10,000 displaced people due the flood situation that occurred in 2020.

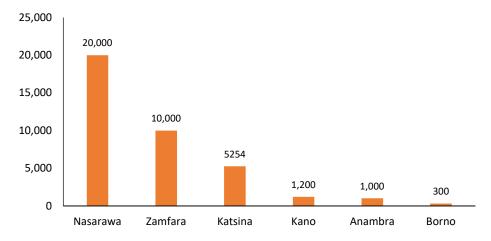

Figure 14.2: People displaced by flood according to States

## 14.4. Farmland/Crops affected by flood

Over 450,000 hectares of rice plantation were submerged while another 50,000 hectares of crops including millet, sorghum, maize and sugarcane were affected in Kebbi State. Kebbi State is one of the major rice growing States and based on the report from the State it is projected that about 25% of rice planted in 2020 will be lost due to flood. Also, many farmlands with cultivated crops were submerged and damaged (Plate 14.2) in Jigawa State. Based on the reports of the flood situations in Nigeria in 2020, the propensity for crop loss is high and yield from crop production in the affected areas is expected to be low. This will bring some forms of economic losses to the farmers and also possibly affect the value chains of the affected food commodities.

Plate 14.2: Flooded farmlands in Kebbi State

#### 15.0 AGRICULTURAL DEVELOPMENT PROGRAMMES EXTENSION ACTIVITIES

## **15.1 Funding Situation**

Adequate, timely and sustainable funding is the backbone of efficient and effective extension service delivery. The nation's ADPs are funded majorly by State Governments and through special intervention/projects and NGOs domicile within the ADPs. Table 15.1 presents the 2020 funding situation of ADPs in Nigeria. Funding was assessed by comparing the amounts targeted with the amount was received by the ADPs. About 40% of the State ADPs did not provide report on funding. All the States that provided report did not achieve the target. Delta, Ebonyi, and Nasarawa realized more than 50% of the target fund in 2020. Generally, the funding situation in 2020 diminished from the 2019 record.

## 15.2 Performance Indicators of ADPs

ADP extension performance indicators assessed included extension staff situation, strategies for technology testing and dissemination, technologies and feedback sharing meetings, extension visits and group development and training activities among others as presented in Table 12.2.

## 15.2.1 Number of Farm Families Reached

Number of farm families is an indication of number of households engaged in any form of agricultural practices for livelihood. Extension agents keep list of farmers within their coverage area. The list is supposed to be regularly updated. Farm families are expected to be reached for technology dissemination. However, ability to reach large number of farm families by the ADPs depends on the number of EAs available as well as provision of tangible mobility for field visit. Regular updating of number of farm families is necessary for effective planning purpose. In fact, the number of farm families determine the number of EAs required by the ADPs. While it is not clear how the ADPs determine the number of farm families, record indicates that Borno and Kano have above 1 million farm families. Also, there is no evidence that the number of farm families achieved were effectively visited.

Table 15.1: Status of ADP Funding in 2019 and 2020

#### 15.2.2 Number of Extension Workers

Extension workers include VEAs, BEA(WIA), and BESs. Effective and efficient extension service delivery is dependent on the quantity and quality of village extension agents (VEAs). Kano State has the highest number (1,105) of VEAs. Other States with significant number of VEAs include Bauchi (266), Niger (221), and Kebbi (156). The least number of VEAs recorded in Rivers (9), Kwara (16), Osun (21), Bayelsa (23), Ekiti (28) and Edo (29). Generally, about 80% of the ADPs have less than 50% of the target number of VEAs. Compared to 2019 record, there was a general decrease in the number of VEAs.

## 15.2.3 Status of Village Extension Agents' Visits

Field visit by extension agents is the most reliable medium for technology dissemination and information sharing. This is due to the practical nature of agriculture and considering the Nigerian farmers socio-economic and technological circumstances. Importantly, field visit by VEAs can be encouraged by provision of tangible mobility. Adequate supervision is also necessary to ensure adherence with visit schedule. The aggregate number of visits by VEAs is dependent on the number of VEAs on board. Kano State recorded the highest number (1,202,073) of visits to farmers. Other significant visits were recorded in Ebonyi (14,120), Niger (12,830) and Cross River (9,824) States. Limited visits were recorded in Kebbi (16), Edo (192) and Enugu States. There was a general reduction in the number of visits to farmers compared to 2019. This could be due to the lockdown resulting from Covid-19 pandemic.

## 15.2.4 Technology/Knowledge Sharing, Transfer and Feedback Mechanism

Enshrined in the Research-Extension-Farmer-Input-Linkage System (REFILS) are mechanisms that guarantee efficient flow of technology from research to farmers through regular interaction between research and extension. Such mechanisms include the Monthly Technology Review Meeting (MTRM) and the Forthnightly Training (FNT). While the MTRM is an interaction between the research institute and the ADPs (via the Subject-Matter Specialists), the FNT offers opportunity for subject-matter specialists (SMSs) to train frontline extension workers as well as serving as a forum to receive feedback from farmers. Only 18 States conducted MTRMs, FNTs or both in 2019. The 2020 record revealed a decline from the 2019 achievements.

## 15.2.5 Technology Dissemination Strategies (OFAR, MTP, SPAT)

Progress in farming practices is highly dependent on availability of proven research outputs/technologies, the adoption of which is capable of increasing farm productivity. On-Farm Adaptive Research (OFAR), Management Training Plots (MTP) and Small-Plot Adoption Techniques (SPAT) are the major strategies adopted by the ADPs to disseminate proven technologies to farmers. The use of these strategies requires adequate provision of input, and should be facilitated by provision of adequate mobility as well as efficient supervision. A cursory look at the available data revealed that technology dissemination is in a critical situation as about

50% of the ADPs did not conduct any of the three trials in 2020. This scenario is worse compared to the 2019 situation. That Nigerian farmers do not have access to improved research efforts can be concluded. List of technologies extended under each of these strategies are presented in Table 12.3.

## 15.2.6 Farmers' Group Development and Management

One of the major tasks of VEAs is the formation, development and management of farmers' groups across all enterprises. Availability of farmers' groups makes information dissemination faster and saves time and efforts expended by VEAs. Group ensures a good medium of enlightenment for farmers to learn from one another for enhanced productivity. Adequate training in group development and management is a pre-requisite for efficient group formation and development by the VEA. In 2019, Lagos, Kwara, Niger, Gombe and Ekiti States reported the development of 500, 400, 108, 90 and 36 farmers' groups respectively. In 2020, 19 States did not provide report on group development. Generally, there is a decline in status of group formation activities across the country.

## 15.2.7 Extension Agent-Farmer Ratio (EA: Farmer)

It is recommended that an extension agent should serve between 800 and 1000 farmers. For extension service delivery, the lower the number of farmers to be serviced by VEA; the more efficient the VEA will be (all things being equal). This underscores the need for more extension agents as the number of farm families keep increasing. Trends in the past 10 years revealed a continuous decline in the number of VEAs across the ADPs in the country. In 2019 survey, record revealed that Kano States had desirable (1:900) EA: Farm family ratio while the highest ratios were reported from Katsina (1:10,000), Edo (1:9,375), Ebonyi (1:8,723) Rivers (1:8,435) and Kaduna (1:6500). The 2020 record shows similar ratio.

## 15.2.8 Trainings of Farmers

Farmers' skill can be enhanced for higher efficiency through regular training and re-training leading to higher productivity. One of the major roles of the ADPs is to ensure regular training (based on identified skill gaps) of farmers across the States. Such training is supposed to be conducted regularly cutting across all the enterprises (crop, livestock, fisheries, agro-processing). Availability of fund and training experts are the drivers of farmers' training. In 2019, information across Nigeria shows that only 6 ADPs conducted farmers' training. There was a sharp decline in the number farmers trained in 2020 across the country.

#### 15.2.9 Status Farmer Field Schools (FFSs)

The farmer field school (FFS) provides a platform for experiential learning through active participation and interaction for information sharing, leveraging on local ecosystem. In 2019,

only 10 ADPs reported activities of FFS. The 2020 record reveals a decline in the number of FFSs.

## 15.3: List of Technologies under OFAR, MTP, SPAT

The list of technologies tried under OFAR, MTP and SPAT was presented on Table 15.8. the. As against 2019 record, 15 States did not present record on any of the three strategies in 2020. This indicates a decline in the number of such trials. In fact, for some States that presented report, there was no record of number of replicates of the technologies in the States.

Table 15.8: List of technologies tried under OFAR, MTP and SPAT

Agro-ecological	OFAR	MTP	SPAT
zone/State			
North East		1	
Bauchi (MTP)		Varietal Promotion	
		-Sampea 14	
		-Tax 1448-2-1	
		-Ex-Sudan	
		-Supa sosat	
		ACR97(maize)	
		-ICSV	
		-Faro 49	
North West			
Kano (SPAT)		-	Control of Aflatoxin -Groundnut Urea usage -Rice advice -Non chemical cowpea storage -Safe use of Agrochemicals -Introduction of SAMNUT varieties
Kebbi (OFAR)	-Demonstration of SAMAS 40 -Demonstration of SAMPEA 14 &16 -Demonstration of upland Rice.		
Zamfara (MTP)	-Promotion Vit A maizePromotion of rice trials/planting technology.		

Table 15.8 (contd): List of technologies tried under OFAR, MTP and SPAT

## 15.3.2 Problems affecting the effective performance of ADPs in Nigeria

The problems affecting the effective performance of ADPs were similar across the States of Nigeria. This shows clearly that ADPs across the six agro-ecological zones are not adequately equipped to perform their fundamental role of advisory services due to the problems identified in Table 15.11 below. We may have to do a re-think and set our priorities right if we are to progress in the development of agricultural sector in the country.

Table 15.11: Problems affecting the performance of ADPs in Nigeria

Nature of problem	States Affected
Poor funding	All States
Inadequate staffing	All States
Inadequate transportation/utility vehicle	All States
Inadequate extension material (Input)	All States
Low EA: Farmers ratio	All States
Inadequate allowances	All States
Inadequate training	All States
Poor media services	All States
Redundancy	All States

Source: NAERLS, Agricultural Performance Survey, 2020

### 15.3.4 NGOs participation in Extension activities

The 2020 APS exercise as documented in (Table 15.12) indicates the NGOs participating in extension service delivery across the six geo-political zones of the country. All the State ADPs with exception of a few like Ondo (SW), Sokoto (NW), Katsina (NW), Akwa Ibom (SS) and Bayelsa (SS) provided information on the activities of NGOs in their respective States. The various NGOs collaborated with the State ADPs in the areas such as extension support, health and nutrition, livestock, crop production, livelihood projects, private extension delivery, value chain, empowerment and technical support. The major NGOs identified included; SG2000, USAID, LAPO, GIZ, UNDP, FAO, ICRISAT, IITA, UNICEF, ICRC, OXFAM, IFAD, Dangote Foundation, and Rockefeller foundation etc.

#### 15.3.5 Trainings Needs

Table 15:13 shows the various training needs of the State ADPs across the six geographical zones of the Country. The major areas of interest included; Crop improvement, Fish production, Livestock production, Water management, Horticulture, Irrigation, use of ICT, Book keeping, pest and disease control, Data collection and analysis, Good agronomic practices, Pod borer resistance cowpea,, Monitoring and evaluation in agric. Business, Mainstreaming gender & the invulnerable groups into developmental programmes, Small ruminant production & management, Good nutrition for children, How to use PCS bags for storage, Post-harvest handing of crops and Monitoring and Evaluation. The category of personnel requiring these trainings included SMS, BEAs, EAs, Enumerators, M&Es, Directors, PMs, Planning officers, WIA/ vulnerable youths and farmer groups in order of their training subject matter. There were

## 15.3.5 Problem Needing Research in the Nigerian Agricultural Sector

Table 15.14 depicts the problems requiring research in the development of the Agricultural sector across the six agro-ecological zones of the country. The priority areas indicated in table shows that for crop production across the six agro-ecological zones needs further research in high yielding varieties and drought resistance crops, improved agronomic practices, seed selection (adaptation to ecology) storage, processing, pest and diseases, research on cocoyam fungal attacks ,technologies to cut down cost of line planting of rice, Stem borer attack in rice, tomato wilt, control of armyworm in maize and use of organic bio-pesticides in pest and disease control. In the case of research needs in horticulture across the zones, the table shows the major areas included; Tomato fruit worms (*Tuta absoluta*), improved varieties of onion and okra, nursing of Fruits and Orchard for higher income generation and production of early maturing varieties of Banana. In the area of livestock production, findings from the survey indicates that research needs are required in improved breeds of poultry, adaptable pasture seeds, feeds formulation and livestock management ,using Leucenea as improved livestock feed for small ruminants, breeding of turkey, coccidiosis in poultry and treatment of young puppies, prevention and control of African swine fever ,alternative cheap sources of energy and protein in feeds, technologies in ranching of mature cattle and improvement of local goat with exotic breed through cross breed. For fisheries, the areas in priority areas in need of research were formulation of fish feed, Fingerlings production and Effective poly-culture management.

More so, in the area of agro-forestry the research needs included agro-forestry model VIETIVA Grass nursery, allay cropping, trial and research on the following exotic plants; apples, olive, grape vines, blue berry, coconut, oil palm and date palm, high yielding varieties and control on termite attack and white flies infection on citrus, termite on coconut. As for agricultural mechanization, the survey reveals that research needs are required in fabrication of manual or animal drawn planters, soybeans threshers, mechanic for preserving vegetable and spices and mechanized palm oil production for small palm oil processor. On research needs for irrigation, findings revealed that the priority areas for research were; water management techniques, development of cost-effective irrigation system, GIS tools and remote sensing skills and effects of drip irrigation system on vegetable production. On WIA, the survey reveals that further research was needed in food, labour saving devises and agro-processing, fruits extraction and fruits juicing, processing and packaging machine to handle waste of our fruits and mushroom production of spores for edible mushroom. Lastly, on the research needs for extension services across the geographical zones of country, the survey indicates that; capacity building and provision of mobility, e-extension through the Farmers Help Line for effective and efficient extension services delivery, mainstreaming (CDD) Community Development Driven in Extension and effective use of Social Media Platforms in Extension Service Delivery.

Table 15.14: Problems requiring research in the development of the Agricultural sector

NORTHWI	EST ZONE	
States	Problem	Areas needing research
Zamfara	Crop	Management of Rice blast, pod borers in Cowpea
	Horticulture	Tomato fruit worms (Tata absoluta)
	Livestock	Research on common Livestock diseases
	Fisheries	Formulation of fish feed
	Agro-forestry	Fruit and flower abortion in mango and cashew
	Agricultural mechanization	Simple weeding and harvesting machines
	WIA	Small Ruminants for Women Empowerment.
		FG/MANR initiative for poverty alleviation located at Wanke village in
		Gusau LG
	Irrigation	Water management techniques
	Extension	Modern value addition on agricultural product
Katsina	Fish	Improved highly prolific fingerlings production
		Fish feeds formulation
	Crop	Lack of high-yielding varieties and Drought resistance varieties of crops
	Livestock	Lack of upgraded breeds
Kebbi	Crop	-Pre/Post harvest technology.
	Horticulture	New breeds of flowers and method of controlling their disease
	Livestock	Animal Disease
	Agricultural mechanization	The use of modern Agric machines, their handling and repairs.
	WIA	Capacity building of women Extension Agents and recruiting of more
		women farmers in the programme.
	Irrigation	Training on water mgt and control of canals in the irrigation schemes
	Extension	Capacity building and provision of mobility
Kaduna	Crop	Inoculant for pulse seeds
		Pest and disease and Improve seeds
	Horticultural crops	Research on pest and disease of mango, guava and citrus
	Livestock	Disease and pest control in ruminants and vaccines among noticeable
		diseases of ruminants
		Poultry feed formulation
	Fishery	Feeds formulation
	Irrigation	Research on dilapidated irrigation facilities across the State
Kano	i. Horticulture	Short duration for production.
	ii. Livestock	-To give birth to twin triplets
		-Production of more milk
		-Crop process in polythene bag
	iii. Fisheries	-Fish Farm maintenance.
		-Formulation of fish feed.
	iv. Agroforestry	-Danger of forestation
	v. Irrigation	-Good water management.
		-Settle water bill
	vi. Extension Services	-GAP
	vii. Women in Agriculture	-To learn how to form group.

Jigawa	Crop	Improved agronomic practices
	Livestock	Livestock development
Sokoto	Crop	Crop varietal trial, G/nut dry season trial and cowpea dry season trial
	Horticultural crops	Tomato heat tolerance varietal trial
		Aphid control in pepper
	Livestock	Introduction of Balami Ram programme
		Silage making in two Zonal offices
	Agro-forestry	Agro-forestry model
		VIETIVA Grass nursery
		Allay cropping

NORTHEA	NORTHEAST ZONE			
States	Problem	Areas needing research		
Adamawa	Crop	Research on Seseme, soybean and cowpea		
	Poultry and livestock	Improved breeds of poultry		
		Adaptable pasture seeds		
	Horticulture	Improved varieties of onion and okra		
	Fisheries	Improved fish production techniques, and fish feed formulation		
	Irrigation	Irrigation scheduling		
	Extension	Good agricultural practices		
	Women in Agriculture	Food processing and preservation		
Gombe	Crops	-Adoption of improved Cowpea (Pbrc) varieties in Gombe.		
		-Control of diseases of sesame production.		
	Horticultural Crops	-Post harvest operations in Tomatoes.		
		-Drying of vegetables (Solar) for proper storage.		
	Livestock	-Heat resistant vaccines		
		-Endo and Ecto parasite control.		
	Fisheries	-Market linkage (Strategies) for Fish-Farming		
	Agro-Forestry	-Amenity Plantation		
		-Shelter Belt		
		-Alley Cropping		
	Irrigation	-Salinity in Fadama Areas		
	Agricultural Mechanization	-Fabrication of Majual or Animal Drawn Planters		
		-Fabrication of Soybeans Threshers		
	Extension Services	-Effective Communication Gadget		
		-Training Manual		
	Women in Agriculture (WIA)	Processing of Tiger nut into powdery form to be used over a long period.		

Bauchi	-Crops	High yield varieties
		Drought tolerant varieties
		Early maturing varieties
	-Horticulture	High yield/early maturing varieties.
		Pest and disease tolerant varieties
	-Livestock	Upgrading of local chicken using improved cockerels.
		Upgrading of Yan-kasa sheep with Sudanis
		Cattle upgrading using exotic breed in terms of dairy production.
	-Fisheries	-Local fish trial and analysis.
		-Common carp seed production and varietal trials
		-Disease, coconut, oil palm and date palm
	-Agroforestry	-Make trial and research on the following exotic plants; apples, olive, grape
		vines, blue berry, coconut, oil palm and date palm.
		-High yielding variety
	-Irrigation	-Pest and disease tolerant variety
		- Early maturing varieties
		- Training blacksmiths on fabrication of modern farm implements.eg
		planter, threshers innovation and mechanization of local farm tools e,g hoe
		and rake.
	-Agricultural Mechanization	-Soil fertility improvement technology
		-Post harvest technology operation.
	-Extension Service	-Produce marketing techniques.
		-Food, labour saving devises and Agro-processing
	-Women in Agriculture	
Borno	Crops	Genetic improvement in crops and training on new technologies in Arable
		crops
	Fishery	Nutritional improvement
Yobe	Crop	Seed selection (adaptation to ecology) storage, processing, pest and
		diseases
	Horticultural crops	Processing methods of fruit and vegetables
	Livestock	Livestock feeds formulation and livestock management
	Fish	Hatching and management of fingerlings and diseases management
	Mechanization	New improved machineries for planting processing and storage
	Women in Agriculture	Development of new processing methods for agricultural crops

NORTH-CE	ENTRAL ZONE	
States	Problem	Areas needing research
Kwara	Crops	-Conversion of organic manure into potable or handful use for farmersBest soil fertility and water management for crops produced in Kwara State.
	Horticulture	-Research on increase in gap or spacing especially on cash crops to encourage canopy development before over lappingNursing of Fruits and Orchard for higher income generation in Kwara State.
	Livestock	-How to resolve conflict between herdsmen and crop farmers within the StateWhat is the best genetic livestock animal for Kwara State.
	Fisheries	-Research on substitutes for higher cost food ingredientsHow to increase and improve Fish production as climate change threatens Fish farming.
	Agro-Forestry	-Tree cropping, Cashew, Cocoa, and Mango value chain development for Kwara State.
	Irrigation	Exploitation for groundwater for irrigation through drilling.
	Agricultural Mechanization	Mechanics for preserving vegetable and spices.
	Extension Services	-Best way to pass innovation to farmers that will make them to adopt new technologies in Agriculture.
	Women in Agriculture (WIA)	Research on vegetable processing and preservation to extend shelf-life of the crops
Kogi	Crops	Response performance of maize varieties under drought condition
	Horticulture Crops	
	Livestock	Using Leucenea as improved livestock feed for small ruminants
	Fisheries	Growth and survival of clarias and Tilapia Zilli using pelleted Feeds
	Agro-Forestry	Control on termite attack and white flies infection on citrus, termite on coconut
	Irrigation	Development of simple and affordable drilling augers that can be operated and afforded by farmers.
	Agricultural Mechanization	Farm labour productivity should be improved through the uses of Agricultural machinery, implements and tools. Also, training of farm machine operators is needed for machine handling.
	Extension Services	E-extension through the Farmers Help Line for effective and efficient extension services delivery.
	Women in Agriculture(WIA)	Fruits Extraction-Fruits juicing, processing and packaging machine to handle waste of our fruits.
Niger	Crop	Rice spacing and farm layout techniques
Plateau	Horticulture Crops	Production of Mangoes, Orange Cashew, Coffee processing juice.
	Livestock	-Breeding of Turkey, Coccidiosis in poultry and treatment of young puppies.
	Fisheries	-Taking care of Finger-lings - Management of fish pond
	Agro-Forestry	-Fruit files research on Mango and Orange -Pre-mature droppings Mangoes, Cashew and Orange, oil line tress.

Nasarawa	Crop	Inclusion of vitamin A in crop gene
		More adaptable higher yield crops & drought resistance varieties
	Animals	Hatching Eggs using local incubators
	Fisheries	Genetics improvement in indigenous specie
	Agro-Forestry	Farming system on agro-forestry
Taraba	Crops	Development of High yielding crop (that will require small land) (to prevent
	Livestock	herder/farmer conflict) Tree-planting attitude
Fct	-Fisheries Post	-Fish feed development. Fish integrated technology
	harvest technologyAgroforestry	Development of post-harvest technology.
		-Training SMS irrigation staff on recent irrigation techniques.
	-Flood plains	Research on flood plains and inundation effects on farming especially dry season farming.
	-Soil fertility	
	- Irrigation	-Soil fertility test training.
		-General staff training on irrigation.

SOUTHW	YEST ZONE	
States	Problem	Areas needing research
Ondo	Horticultural crops	Indigenous crop production
	Livestock	Using non-conventional feed ingredients for feeding livestock
	Fisheries	Fish fry mortality
		Appropriate fish processing method
		Local production of fish feed of low cost
	Irrigation	Development of cost-effective irrigation system.
		GIS tools and remote sensing skills

#### 16.0 SPECIAL PROJECTS

The APS 2020 report on special projects as highlighted in the table 16.1 indicates that about 23 States gave a comprehensive data on the activities of the special projects in their respective States. The remaining 14 States which includes Osun, Kano, Kogi, Ekiti, Sokoto, Kaduna, Imo, Ogun, Oyo, Anambra, Ondo, Rivers and Ebonyi did not presented data on the subject matter. A few of the special projects listed in Table 16.1 include AGRA in some North West and North Central States of the country. The priority attention was on training and capacity development for CBAs/CDAs and crop improvement majorly for rice and maize value chain.

Also worthy of mention is the Climate Change Adaptation and Agribusiness Support Programme (CASP) which is a seven-year programme (2015-2021). CASP is being implemented in seven Northern States of Nigeria: Borno, Jigawa, Katsina, Kebbi, Sokoto, Yobe, and Zamfara, targeting a total of 727 village areas (VAs) across 104 Local Government Authorities (LGAs). With a projected outreach of 727,000 households, CASP's primary objectives include: (i) pulling 242,000 people out of poverty based on the matrix of a daily income of US\$2.0 per capita (World Bank definition); (ii) generating a 30 per cent increase in net income for targeted households; and (iii) increasing by 40 per cent the number of farmers with reduced erosion in their cropping fields. It promotes agriculture as a business to enhance the income and livelihoods of farmers along some selected value chains. The project promotes productivity enhancement, using agriculture as a principal driver. It integrates climate change resilience adaptation measures, and has a private sector orientation in the provision of extension services. The programme is jointly financed by Federal, participating State Governments, participating communities and the International Fund for Agricultural Development (IFAD). The priority target groups were the moderately poor and the productive core poor households, who represent over 90% of the population in the programme area States. A particular focus on targeting women and youth was reflected in all programme activities. Seven commodities were selected based on their prevalence in the programme area and market opportunities. These are rice, sorghum, maize, cowpea, wheat, groundnut and millet. A key focus area of the programme's interventions is on creating and strengthening enterprises and activities that are directly linked to adding value to production, processing and marketing and addressing constraints along the value chains of the selected commodities.

More so, another special intervention project that is worthy of mention is SSA Global 2000 with impacts in some States of North East and North West zones. The priority collaboration varies from Education (Safe, Sasakawa Foundation), crop productivity, post-harvest and agro-processing.

Other priority reports of special projects in some other States in the SE, SS and SW focused mainly on root crops value chain technologies, livestock value chain and marketing. These projects were facilitated majorly by RTEP, NPFS and World Bank.

# 17.0. GENERAL CONSTRAINTS TO AGRICULTURAL PRODUCTION

The section of the survey classified agricultural constraints or challenges to nine (9) areas: Covid-19, rainfall/ weather, farm inputs, production/labour, mechanization, extension activities, agricultural broadcasts, e-extension and insecurity. The data are presented according to the spread for the country, using the number of States as unit of measurement.

#### 1. Constraints related to Covid-19 Pandemic

The year 2020 experienced the global Covid-19 pandemic, which affected all economic activities, including agriculture. Consequently, the data in Figure 1 show that the most widespread constraint of the pandemic was the increase in prices of inputs (90%), followed by shortage of farm labour (67%), which was due mainly to restricted mobility (60%) both in the rural and urban communities. As at 30th September 2020, this pandemic had affected about 33.7 million people, of which 1.1 million have died globally. In Nigeria, it affected about 59 thousand and killed about 1,110 people. The number of infection cases and deaths thus made over 35% of farmers to be afraid of contracting the disease through contact with infected persons while attending to their farm enterprises.

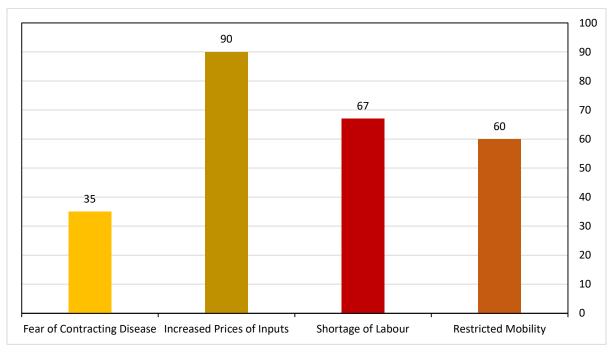

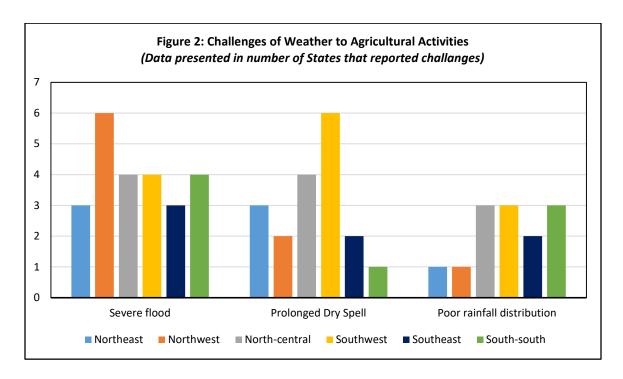

Figure 1: Constraints related to Covid-19 Pandemic (data presented in %)

### 2. Rainfall and Weather-related Challenges

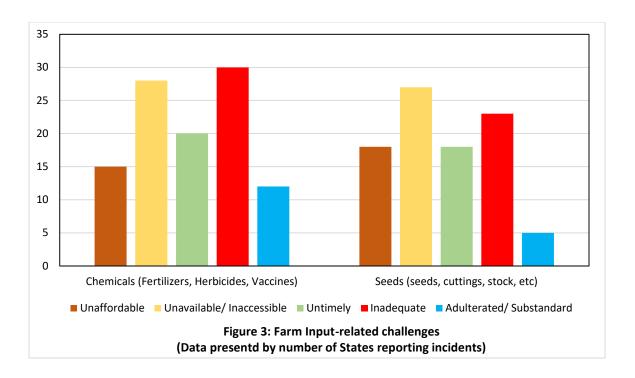

In early February, the Nigerian Meteorological Agency (NIMET) warned in its Seasonal Rainfall Prediction (SRP) in Abuja that Nigerians should prepare for heavy rainfall that may result in flooding and other social disequilibria in some parts of the country. Consequently, between 10th and 16th September, more than 20 persons were reported dead and hundreds of thousand

hectares of rice, maize and sorghum fields destroyed in the northwest alone. The data (Figure 2) also affirm these predictions of NIMET, showing that severe flooding was most frequent in the northwest; moreover, occurrences of prolonged dry spells (of about 5 weeks) were reported to have grossly undermined farming activities in the southwest, where it was reported that it lasted in about five States for more than 5 weeks during the season. Poor rainfall distribution was reported in 3 States each for the north-central, southwest and south-south zones.

### 3. Farm Input provision, availability and accessibility

In Nigeria, agricultural productivity is mainly dependent on adequate rainfall and quality of inputs used (such as seeds, animal stocks, fingerlings, fishing nets, fertilizers, herbicides). The 2020 data in Figure 3 show that government inputs were largely inadequate in 30 States (for seeds and stocks) and 23 States (for chemicals); and unavailable/inaccessible in 28 States (for chemicals) and 27 States (for seeds and stocks). The implication of these data is that agricultural productivity was more constrained by input availability and accessibility that it was in 2019.

## 4. Challenges of labour and pests/diseases

The management of a farming enterprise has important implications for agriculture in Nigeria, where the majority of the farmers are smallholders with low agricultural productivity. Insect pests and plant diseases, for example, are major yield-reducing factors, threatening food security and farmers' incomes. Such pests and diseases can lead to as high as 50% yield loss in some crops. Farmers who actively manage pests rely primarily on chemical insecticides, but which are often constrained by the cost and availability of such chemicals (see Figure 3). The other major farm production challenge is labour cost and availability. The data in Figure 4 show that the highest challenge to agricultural production in 2020 was high cost of labour (both manual and mechanical), as 36 States reported dramatic increases in costs of labour, such as land preparation, planting, weeding and harvesting. This is followed by high prevalence of diseases (for crops and livestock). This trend is similar to what was reported for the 2019 season. The data also showed the presence of pests and diseases on crops, as well as on livestock in 30 and 23 States respectively. There were widespread reports of new castle disease, Gamboro and coccidiosis on poultry; CBPP, tuberculosis and foot and mouth disease on cattle; PPR on sheep and goats; birds and snake attacks on fish.

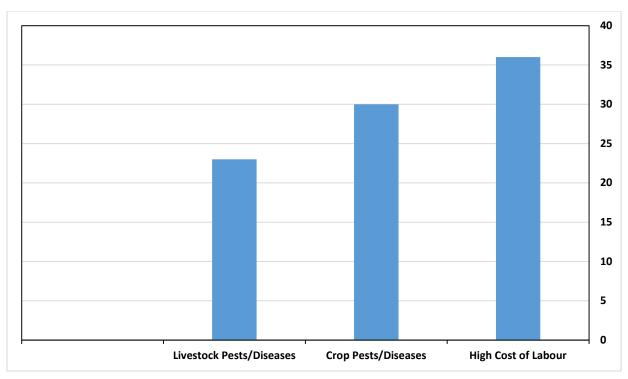

Figure 4: Farm Input-related challenges (data presented in number of States reporting incidents)

#### 5. Agricultural Mechanization

There has not been much difference in data on agricultural mechanization for the past four years. Comparatively, however, there are some slight changes between data for 2019 and 2020. Figure 5 shows that Nigerian farmers fared better in 2020 with regard to tractor availability/accessibility and cost of hiring than in 2019 - with 29 and 30 States in the current year, as against 31 and 32 States in the previous year, respectively, reporting these challenges. With regard to the provision of quality irrigation facilities, as more States were constrained in 2020 than in 2019. Cumulatively, however, 2017 seems to be the most constrained year for the farmers on agricultural mechanization.

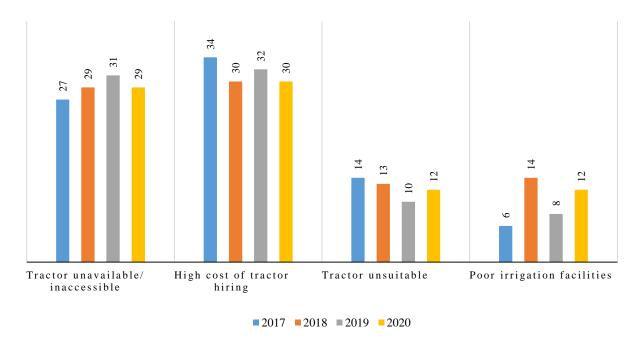

Figure 5: Comparative Data on Mechanization (2017-2020)

#### 6. Extension Provision Activities

Extension is a major key to the development of a country's agricultural sector. Without the right application of agricultural technology, no farmer can maximise productivity. The 2020 survey data showed that extension activities have continued to be in a decline, a worrisome trend since 2009. The data in Figure 6 show that the ADPs, who are the primary extension providers in the country, were highly under-staffed and underfunded. This poor funding situation is responsible for the very low level of staff capacity and absence of vehicles for fieldwork. The implication of these is that farmers are left without quality information for agricultural decisions. The data show that as much as 24 of the 36 States and the FCT had zero release of fund for capital project in 2020; more so, 10 of the 13 States that had some level of fund release indicated that what they got was inadequate. The three-year comparative data show that the 2020 situation was neither better nor worse than those of previous years.

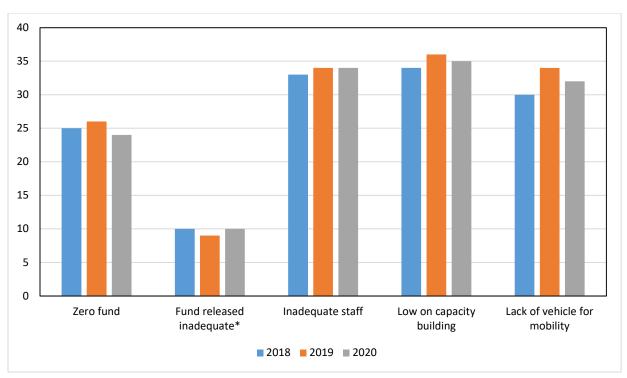

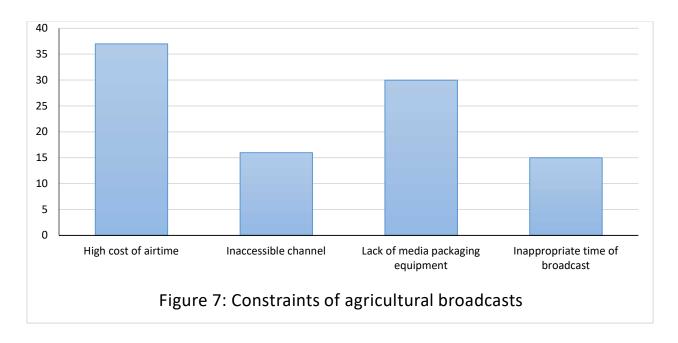

Figure 6: Comparative data on constraints related to ADP activities (2018-2020)

NB: \*Of the ADPs that got funds for capital projects (13, 10 and 13 ADPs for 2018, 2019 and 2020 respectively)

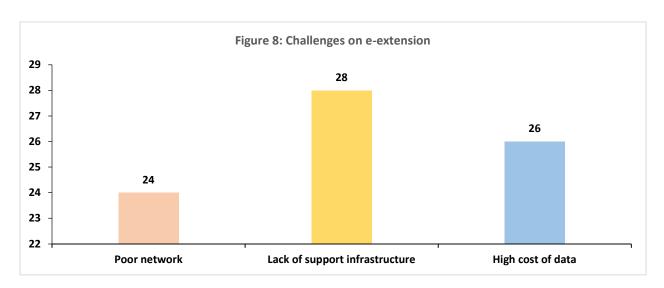

# 7. Agricultural Broadcast

Each State ADP is expected to produce and disseminate agricultural information through conventional and new media to farmers in the languages and formats they are familiar with. The consequence is that farmers are deprived the requisite information for quality agricultural decisions. The survey data in Figure 7 show that all the 37 ADPs have been constrained by high cost of airtime to effectively produce and air agricultural programmes. The activities of agricultural broadcast and information dissemination in the States have been highly compromised by the poor financial and other resources (see Figure 6). Moreover, 30 ADPs were constrained by the lack of equipment to make such production. Notwithstanding, several States acknowledged that some agricultural broadcasts were produced and aired by agricultural organizations in the private sector, solely or in collaboration with the ADPs.

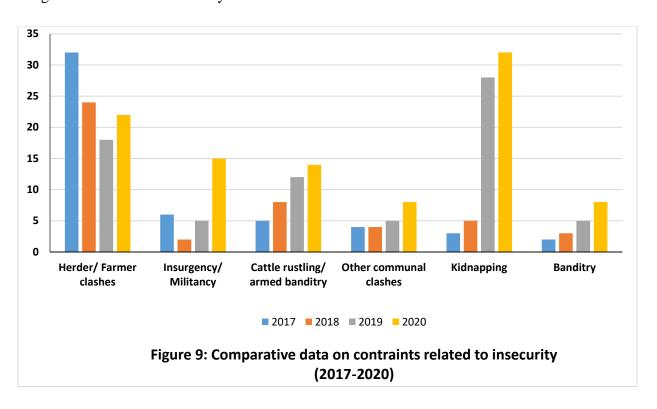

#### 8. E-Extension

The survey data in Figure 8 reveal that staff of 28 ADPs and 26 ADPs were not able to effectively use e-extension channels due to inadequate support-infrastructure and high cost of data, respectively. This way, the Nigerian public extension service providers were unable to key into this crucial global infrastructure for information dissemination and professional collaboration and partnership in modern agriculture—this includes access to and use of the National Farmers Helpline Centre that has been established by the government for the good of our farmers. Indeed, profitable agricultural advisory services have shifted from conventional methods to the use of new media, using today's information and communication superhighways or the Internet. In consideration of the data in Figures 7 and 8, this means that the chances of Nigerian farmers to receiving real-time agricultural information in 2020 were very slim.

# 9. Security-related Challenge

The data in Figure 9 show that there has been a drastic increase in insecurity matters across the nation. The data show that herders/farmers clashes, which reduced between 2017 and 2019, have taken an upward trend in 2020. In fact, the data show increases for all the indicators of insecurity with regard to farming—cattle rustling, kidnapping, militancy, banditry, communal clashes, etc. While the 2019 data showed decline in militancy activities especially in the south-south, southeast, and northeast, the 2020 data are showing worrisome trends. It is well known that violence and insecurity do have far-reaching implication for economic development, especially in the areas of agriculture and foreign direct investments. The 2017-2020 data are suggesting that violent crimes and armed conflicts are not abating and that these are having deleterious effect on agriculture in Nigeria. Kidnapping and terror attacks have, for example, taken a completely dangerous dimension in recent years.

# 18.0. CONCLUSION AND RECOMMENDATIONS

#### 18.0. CONCLUSION AND RECOMMENDATIONS

The 2020 Wet Season Agricultural Performance Survey in Nigeria was conducted with the support and collaboration of all State ADPs and ministries of agriculture and many other organizations. The survey has presented a vivid picture of agricultural activities and development in the country. The results indicated, among others, that the Covid-19 global pandemic greatly affected agricultural activities in the country. The results also highlighted the challenge of rising insecurity situation, as well as the declining State of extension provision in the country and its threat to national food and nutrition security. As a result, the field outlook for 2020 and production forecasts showed that outputs will be less than those of 2019 in nearly all areas of agriculture. Therefore, the following recommendations are made:

- 1. Investment in climate-smart agriculture: The incidences of epidemic floods, draught pests and disease across the country are becoming very frequent and worrisome. Research in climate change have shown that it is imperative for governments across the world to develop climate adaptation technologies. Thus, there is the need for government to increase investment (funding and infrastructure) as a rapid response strategy (involving specialists in agricultural research, extension, and climatologists) for correcting this monumental imbalance in agriculture and the ecosystem. The strategy should take into cognisance the development and promotion of disease-resistant, drought-tolerant, flood-tolerant, and early maturing varieties.
- 2. Development of strategy to strengthen agricultural extension activities: This survey has established that, since 2009, extension activities have been on the decline, mainly due to dwindling funding for capital projects. This problem has led to low capacity development of extension personnel, unavailable extension packages, and lack of mobility vehicles for field visits, poor extension-farmer contacts, low technology transfer (MTPs, FNTs, SPATs, OFARs, FFS, etc) and farmers' group management, among others. There is thus the need for governments at both State and federal levels to develop a strategy for efficient and timely funding of ADPs and other relevant agricultural extension and advisory providers in the country. The strategy should also include the recruitment of more staff to replace retired or dead ones.
- 3. Building a lasting and sustainable grass-root extension delivery institutions at Federal and State Government levels. Agricultural extension service is the bridge between research and farmers and therefore should have institutional structures on ground that are not subject to vagaries of administrative changes. The States ADP have long been the grass-root extension delivery structure in the country. The Federal Ministry of Agriculture AND Rural Development should intervene in the recent scrapping of Oyo

State ADP and the deployment of all her staff to the State Ministry of Agriculture. The ADP has served farmers in the State through her extension delivery mandate under successive administrations. It is a dysfunctional approach to collapse the structure by a government that have been showing interest in agricultural development.

- 4. Evolving a definitive action plan on stemming insecurity: The spate of insecurity in the country in 2020, especially with implication for agricultural activities, became unbearable. Kidnapping, armed banditry/ rustling activities, and herdsmen/farmer conflicts and militancy had risen to an alarming proportion. Large farmlands were overrun by armed bandits and herders, and farmers were frightened out of their lands across the country, to the point that many have now completely abandoned farming activities. Indeed, government has made tremendous efforts in containing the activities of militants and insurgents in recent years; but rather than abating, incidences of insecurity seem to be on a continuous rise. The government needs to evolve a more definitive action plan to stem the challenges of insecurity for the nation.
- 5. Enhancing productivity through an effective input subsidization blueprint: Although there was level of government support and intervention in the area of subsidised inputs to farmers, a large number of the farmers could not access such support; the few who had access could not afford the subsidized prices, while those who could afford them could not get enough for their farming needs. A compromise on agricultural inputs is a compromise on yield quantity and quality, as well as on income. There is thus a need to evolve a cost-effective and efficient input subsidization blueprint especially on seeds/seedlings/breed stock, chemicals and credit.
- **6.** Increasing support to the National Farmers Helpline as an e-Extension strategy to boost advisory delivery: The ratio of extension agent to farm families has remained astronomically low about 1:14,000 for some States, instead of the FAO recommended 1:1000. Also, the high rates of mobile phone and internet penetration of the country, as well as the large population of youths create an enormous opportunity for an e-extension blueprint that will ensure a robust agricultural knowledge and information database. In this regard, the National Farmers' Helpline should be given all the necessary support (human and material resources, as well as a conducive policy environment) to be fully operational. The Helpline Centre should be facilitated to secure a short-code (of 4 digits) for operation with the help of NCC and FMARD; currently, it uses a SIM bank and a regular 11-digit phone number for its calls, which is not user or cost-friendly. Therefore, to achieve an information-based and ICT-driven agricultural extension system, the Helpline should be in full operation, with subsidized calls to and from farmers, to strengthen their production-enhancing indicators.

7. Setting up of an Agricultural Trust Fund to cater for farming activities, especially in periods of emergency: The impact of the global Covid-19 pandemic on agricultural productivity in 2020 has been enormous. Although the havoc of this pandemic was felt globally and there was some forms of palliatives given to Nigerians, the impact could have been minimised if an agricultural trust fund had been in operation. Therefore, the government should set up an agricultural trust fund that would cater for farmers and farming activities, especially during periods of emergency. A component of the Draft Policy on Agricultural Extension for Nigeria, which is currently with the Federal Ministry of Agriculture and Rural Development (FMARD) concerns the operation of a trust fund on agricultural extension – this takes care of farmers, farming inputs, and agricultural advisory. Therefore, it is important that Government expedite action on legalising this policy document through an accelerated passage at the National Assembly.
